ARTICLE:

Planning and Coordination
of Statistical Programs in a
Central Statistical Office

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * *

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.
- MCD months for cyclical dominance (see above).

1. Wages and Salaries, by Province	40	6. Metals	76
2. Wages and Salaries, by Industry	41	7. Non-metallic Minerals	77
3. Labour Force	42		
4. Labour Force, by Region	42	Section 8. Construction	
5. Employed, by Region	43	1. Building Permits, by Type	78
6. Employed Non-agriculture, by Region	43	2. Building Permits, by Province	78
		3. Dwelling Units, Started, All Areas	79
		4. Dwelling Units, Completed, All Areas	79
		5. Dwelling Units, Under Construction, All Areas	79
		6. Dwelling Units Started, Centres 10,000 and Over	80
		7. Dwelling Units Completed, Centres 10,000 and Over	80
		8. Domestic Shipments of Building Materials by Canadian Manufacturers	81
		9. Mortgage Loans, Approvals	82

Section 9. Food and Agriculture

1. Farm Cash Receipts, by Source	83
2. Farm Cash Receipts, by Province	83
3. Farm Implement and Equipment Sales at Wholesale Prices, by Province	83
4. Slaughter and Cold Storage Stocks	84
5. Selected Agricultural Price Indexes	84
6. Exports of Grains and Livestock Products	85
7. Milk, Milk Products and Eggs	85
8. Fish	86
9. Manufactured Food	86
10. Sugar	87

Section 10. Domestic Trade

1. Value of Retail Trade	88
2. Department Store Sales and Stocks	90
3. Wholesale Sales	90
4. Chartered Banks' General Loans	91
5. Retail Credit, by Type of Store	91
6. Consumer Credit, Selected Holders	92

Section 11. External Trade

1. Merchandise Exports, Major Countries and Areas	93
2. Merchandise Imports, Major Countries and Areas	94
3. Merchandise Exports, by Commodity	95
4. Merchandise Imports, by Commodity	97

Section 12. Transportation

1. Carloadings of Revenue Freight	99
2. Railway Operating Statistics	100
3. Operating Statistics of Canadian Motor Carriers	100
4. Operating Statistics of Canadian Air Carriers	101
5. Operating Statistics of Canadian Pipelines	101
6. Shipping and Canal Traffic	102

Section 13. Finance

1. Bank of Canada	103
2. Chartered Banks	104
3. Currency and Chartered Bank Deposits	105
4. Cheques Cashed in Clearing Centres	106
5. Life Insurance Sales	107
6. Life Insurance Payments	107
7. Security Issues and Retirements	108
8. Security Prices	109
9. Stock Exchange Statistics	110
10. Commercial Failures and Liabilities	110
11. Government Revenues	111
12. Government Expenditures	111

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 7, Table 6—Metals

The former title of the column "Mint receipts" has been corrected to "Mint gold purchases"; data of this series remain unchanged.

Section 7, Table 7—Non-metallic Minerals

Data on "Salt production" have been replaced by "Producer's shipments" of salt, to introduce a more meaningful series.

Section 10, Table 5—Retail Trade

Data in this table have been revised to new benchmarks provided by the 1961 and 1966 Censuses of Merchandising (Retail Trade). The new presentation shows a breakdown of 18 kinds of business. The revised series on department stores and furniture, television, radio and household appliance stores also appear monthly as components of the national estimates of consumer credit in Table 6, Section 10 where the other remaining kinds of business groups are shown quarterly.

Section 10, Table 6—Consumer Credit Outstanding

Owing to the special adjustments required for breaks in the continuity of the unadjusted series for (a) instalment sales financing in both January 1970 and again in January 1971, and (b) other cash loans of consumer loan companies from January 1971, seasonally-adjusted data are not available at the present time.

Section 13, Table 9—Stock Exchange Statistics

Data on "Call loans" are no longer collected and have therefore been deleted from this table.

PLANNING AND COORDINATION OF STATISTICAL PROGRAMS IN A CENTRAL STATISTICAL OFFICE

W.E. Duffett and S.A. Goldberg*

SECTION I. Introduction

We shall use the word planning in its usual sense as a process involving "assessing the future and making provision for it". (5) It involves formulation and systematic appraisal of objectives in changing circumstances and policies and actions deemed necessary to achieve them. It is appropriate that "planning" in this sense should be coupled with "coordination", simply because one of the main challenges of statistical planning is precisely to render coherent the various statistical programs and activities and to ensure that they are in balance with one another. We shall use the word coordination to include the concept of statistical integration, as well as that of balance between statistical programs. Most of what we shall say is probably relevant for periods which are longer than one year and shorter than, say, seven years.

An assessment of the future also involves appraisals of the past. For in statistics, as in other fields, the future is a stage growing out of past accomplishments and failures. What can be done the next few years is dependent on a host of constraints, one of which is the capability level the organisation has achieved as a result, in part, of its past planning. In this article we shall try to distill some generalisations in regard to planning and coordination in a central statistical office. Inevitably these generalisations will reflect the past experience of Statistics Canada, the central statistical bureau of the Government of Canada.

In principle, at the national level, the objectives of planning and coordination of statistical programs in a country with a central statistical office is not different from that of a country with decentralised offices and a central coordinating body. In both cases, at that level, the aim is to develop an up-to-date, comprehensive and flexible system to provide quickly good and relevant information for decision-making and research. There are, however, differences in the ease with which specific objectives are identified and effective strategies and techniques for overcoming constraints applied. We shall comment on some of these differences later.

Planning and coordination of the national statistical system has to be carried out with due awareness that it is part of a more comprehensive national (and international) information flow. In the first place even the most centralised statistical office has no all-embracing mandate. While most of the statistical work at the national level is the responsibility of Statistics Canada, a small but not insignificant portion is carried out by other government departments, while each of the ten provinces are engaged in statistical activities in varying degree. Secondly, various institutions of the nation—business, government and non-commercial—have their own information flows which, on the one hand, are often used in conjunction with statistical data

and on the other, provide the raw material for the statistics. We shall make reference to this broader flow later.

Planning can be formal and informal. In the past in Statistics Canada and, we believe, most other statistical organisations, planning was in general done in an informal way. However, in recent years, as the organisation grew in size and complexity and as the Treasury Board expectations associated with the introduction in the Federal Government of the Planning Programming and Budgeting System (PPB) became more pronounced, a strong need has emerged for a more formal approach to planning, that is one with a visible and self-sustained structure whose operation and utilisation is explicitly supported by management. Such a formal approach involves the development of a planning system, including appropriate control procedures.

A complete version of such a planning system would include a multitude of interrelated modules—subject matter, methodology, research, integration, automation, production, marketing, finance, manpower, training, accommodation, and hardware. The utility of such a system is that it would provide a comprehensive framework within which the various factors which determine success or failure in achieving the objectives of statistical programs can be analysed and evaluated with due regard to their interdependence.

The development of such a comprehensive system has been a long-term goal of Statistics Canada which, however, is still some distance away. For this article we have selected a number of issues for discussion and grouped them under three major headings: First, *subject matter planning* and *coordination* dealing with the outputs of statistical activities. This is covered in Section II. We have also found it convenient to include in this section some considerations related to data inputs (as well as some related methodological aspects) which could be classified perhaps more logically, under the second main heading, namely, *resource planning*, in Section III. This section includes reflections on production planning, computer planning and some related manpower and associated matters involved in the efficient creation of the end-products. In Section IV we discuss *planning methods*, that is, some technical aspects associated with PPB. In Section V we make some concluding remarks.

* Mr. Duffett is The Chief Statistician of Canada and Mr. Goldberg The Assistant Chief Statistician (Integration and Development). This article was presented as a paper to the International Statistical Institute annual meeting held in Washington D.C., August 10-20, 1971. The authors acknowledge with thanks the assistance received in preparing this paper from several colleagues and especially David A. Worton, Director of Planning in Statistics Canada.

SECTION II. Subject Matter Planning and Coordination (and Some Related Matters)

Planning of subject matter programs should take into account the essentially unified character of the statistical system. Its unified character stems from the fact that, as a rule, the various constituent series have more than one use and that they measure different aspects of interdependent social and economic phenomena.

Practically all social and economic statistics have more than one use in two senses. First, the statistics serve at least two purposes: they play a role in themselves in describing specific phenomena, for example, characteristics and trends in the chemical industry, the agricultural industry, universities, hospitals. In addition, they serve as elements of more aggregative phenomena, or as indicators of related phenomena, for example, the functioning of the economy and its parts, or the general state of higher education. Second, they are part of an interrelated structure of information supporting a variety of policies and programs. For example, while statistics on the characteristics of universities (the number enrolled, graduated, expenditures and so on) are essential in developing and evaluating educational programs, this clearly requires related manpower, occupational, demographic, income and host of other data—all of which are used for other programs as well, as indeed are the education statistics.¹ All these data must be sufficiently comparable to permit such interrelated, cross-classified and diverse analyses. Definitions, classifications, methodologies and so on should, of course, be mutually coherent not only between the various parts but, as far as possible, over time to preserve historical continuity to facilitate analysis of change as well as cross-section analysis.

The unified aspects of the system and its constituent parts bears the emphasis of repetition because frequently planning of subject matter programs take the form of specific responses to specific demands—for, say, more or better statistics on education, or occupations, or health, or construction. Thus, much of the process of developing statistics has been something like this: adding new data, filling gaps, reconciling parts, developing detail, putting detail together in new ways, etc., reflecting a strong, vertically-oriented pull to serve seemingly unconnected needs in specific fields. Since in practice, most problems have many facets and are interrelated with other problems, it is important to conceive and develop statistical programs as integral elements of a mutually consistent, horizontally-oriented system. This way of viewing the statistical system is conducive to specifying its myriad elements in such a way that they can be

more readily manipulated to respond flexibly to unanticipated demands as well as those which are anticipated.

The preceding has considerable implications for cost-benefit analysis, priority setting and budgeting, and we shall return to it in Section IV, but we now proceed with the discussion of subject matter planning.

The distinguishing advantage of a central statistical bureau is that it is better geared to plan and implement an integrated system of statistics, such as just described, than a decentralised one. There are other advantages, such as the more complete utilisation of overheads and scarce skilled human resources. A centralised system has also disadvantages. The most important of these is the danger of becoming isolated from government use of statistics and thereby impairing its capacity for ensuring relevance in some of its programs. Another is that, in its preoccupation with achieving balance in the statistical system, it may fail to respond with sufficient urgency to particular departmental programs. It is the objective of planning in a central statistical institution to exploit fully its natural advantages and to reduce to a minimum the potential disadvantages. Some of the instruments which have been used to achieve this are described briefly in what follows.

Instruments for Subject Matter Planning and Coordination

Just as a successful business firm must maintain constant watch on the changing character of its markets in order to plan in the light of anticipated changes so must a statistical agency detect and evaluate explicit demands and emerging needs. To plan the subject matter effectively it is necessary to have a constant and full flow of information providing indications of the changing character of the demands and needs of users, both those which are specified by them and whose which are as yet ambiguously conceived or even invisible to them. A central statistical agency covering a great diversity of subject matter fields and having substantial influence on priority determination, must take special care to develop devices for monitoring the outside world radar-style, as it were, although this is clearly also important for decentralised bureaus. What are the major instruments for achieving this?

Organisational and Research Instruments

One of the major instruments is to create bridges with the outside world and ensure that they are utilised effectively. In case of Statistics Canada, and we believe other central statistical offices, the major organisational unit is the statistical division which consists of a related set of subject matter fields and is managed by a director

¹ "Partial policies, based upon some narrow band within the whole spectrum of relevant knowledge, may cause more indirect harm than direct good, and will always require costly modification, improvisation and patching when unexpected and unwanted effects appear." (4)

who is familiar with these fields. The divisions are subdivided into sections, each dealing with (more or less) homogeneous groups of topics, headed by a chief who is expert in the subject matter encompassed by his section which is usually staffed by a number of subject matter professionals (as well as administrative staff). They are assisted by subject matter and methodology experts who have been placed at various central locations in the organisation.

One of the purposes of this organisational structure is to provide bridges for communicating with users of statistics in various fields and facilitating detection and evaluation of user needs. Various formal and informal arrangements have evolved to supplement these bridges. Formal arrangements take the form of advisory committees which now exist in almost every subject-matter field. These vary a good deal in size and frequency of meetings. Interdepartmental committees are almost invariably formed during developmental stages of important new statistical programs and they frequently continue to function after programs are underway to consider new developments. At present, in Statistics Canada, there are about fifty active committees at the federal level; with the provinces there are over thirty; with business users, there are about fifty. There are also committees with representatives of the academic community.

The very process of preparing for the meetings of these committees forces statistical officials to take stock and to become more attuned to emerging requirements. Constant effort is required to keep the committees alive and to render them effective. They must be up-dated from time to time to take care of new developments. At the provincial level a focal point was created in Statistics Canada to coordinate contacts and activities which has proven invaluable for facilitating cooperation.

At least as important as committees are the more informal type of personal relationships which are fostered between the statistical officials and those of user organisations in the course of carrying out their daily work. The telephone, the luncheon, the personal visit, the *ad hoc* working group are important tools for a meeting of minds. These informal personal relationships serve, as well, as occasions for clarifying issues and anticipating problems. Thus they provide needed background and help to strengthen understanding of problems of mutual interest which may be aired more formally during meetings and conferences.

This highlights the importance of equipping the statistical office with subject matter analysts to act as focal points and to help it penetrate the user's mind, so to speak. The statistical office should plan to leave its professional workers free time to cultivate needed contacts and to make themselves available when personal advice or consultation is sought. More than that, however, resources should be planned for and acquired to carry out methodological and analytical research throughout

the organisation. Such work has important feedback benefits in that it helps clarify difficult conceptual, methodological, data and presentational issues. Further it provides practical experience, helping the statistical officers to develop the kind of comprehension that evolves from actually working with the data—a comprehension not only of the surface problems, but of the more intractable, practical complexities. Such comprehension is required for evaluating many of the contemporary demands for data and developing strategies for meeting them. A central statistical office has a responsibility for planning and developing such capacities not only because it must render the statistical programs relevant and balanced but also because it is expected to act as an effective spokesman for the user community in regard to acquiring funds and other resources to satisfy user needs.

Moreover, because of the long lead time involved in developing data, statistical agencies must exercise foresight about the lines of data needs and analysis which are likely to become important in future years. The decisions on priorities made by the statistical office have a considerable and perhaps decisive influence on the shape of analysis that the users will be able to make in the future. In order to carry out its priority decisions in a perceptive and responsible way, it is necessary for the statistical office to be intimately familiar with the prevailing analytical developments. This is best achieved by being involved directly in analysis and model building, preferably in collaboration with major users. Such work is a major countervailing influence to the danger of isolation referred to above and should therefore be an important feature in the plans of a central statistical institution. It should be noted, however, that difficult problems persist in anticipating government (or private) policy developments far enough in advance to be ready always with the information when it is needed. New government policies are not necessarily introduced as part of a scheduled and predictable response to long-run social and economic needs.

The activities just outlined are not only conducive to acquiring better insights of user requirements but as well to strengthening integration in specific fields because in working with the data in analysis one becomes more aware of the seriousness of lack of coherence in them. Before turning to other, more specific, vehicles for planning such integration we wish to say something here about the other part of the spectrum of contacts between the statistical office and the outside world, namely, the respondents, who provide the raw material for the statistical end-products, and provincial producers of statistics.

The organisational arrangements described above also provide effective bridges for studying the circumstances of respondents whose goodwill must be fostered constantly. This involves the maintenance of unquestioned confidence that the secrecy of individual returns is fully protected, development of good public relations, educational

LABOUR FORCE (More detail in Section 4, Table 3)

THE LABOUR FORCE SITUATION SHOWED LITTLE CHANGE BETWEEN OCTOBER AND NOVEMBER; THERE WERE SLIGHT DECLINES IN THE EMPLOYMENT AND UNEMPLOYMENT LEVEL. THE UNEMPLOYMENT RATE FELL MARGINALLY TO 6.6 PER CENT FROM 6.7 PER CENT RECORDED IN OCTOBER.

	total labour force	total employed	employed non-agriculture	unemployed	unemployment rate	not in the labour force
	thousands				per cent	thousands

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2.3)

THE SEASONALLY ADJUSTED INDEX OF INDUSTRIAL PRODUCTION INCREASED BY 0.5% IN OCTOBER TO A LEVEL OF 181.4 FROM 180.5 IN SEPTEMBER. ALL THE INCREASE CAME FROM MANUFACTURING, WHERE BOTH DURABLE AND NON-DURABLE GOODS OUTPUT SHARED IN THE GROWTH.

		total industrial production (1961=100)	(1961=100)			(1961=100)	
			manufacturing (1961=100)			mines (incl. quarries & oil wells)	electric power, gas & water utilities
			total	durables	non-durables

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

FALLING SALES IN MOST AREAS OF RETAIL TRADE — NOTABLY JEWELLERY STORES, SERVICE STATIONS AND GARAGES, AND FAMILY CLOTHING STORES — CONTRIBUTED TO A MODEST DECLINE OF 0.4 PER CENT IN OCTOBER. SALES OF GROCERY AND COMBINATION STORES AND OF DEPARTMENT STORES EACH FELL 0.2 PER CENT; GAINS WERE RECORDED BY DRUG STORES, HARDWARE STORES, SHOE STORES AND FUEL DEALERS.

ALTHOUGH UNIT SALES OF NEW COMMERCIAL VEHICLES ROSE BY NEARLY 10 PER CENT BETWEEN SEPTEMBER AND OCTOBER, A DROP IN PASSENGER CAR SALES RESULTED IN AN OVERALL DECLINE OF 1.4 PER CENT. THE MOST SEVERE LOSS WAS IN OVERSEAS-MANUFACTURED PASSENGER CARS WHICH FELL BY 6.9 PER CENT.

TOTAL PASSENGER CARS SALES DECLINED 7.5% IN NOVEMBER REFLECTING A DECLINE OF 12.4% FOR SALES OF NEW CANADIAN AND U.S. MANUFACTURED CARS. THE SALES OF NEW OVERSEAS MANUFACTURED CARS SHOWED A 2.7% INCREASE; COMMERCIAL SALES WERE DOWN 1.5%.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts.

²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between recorded measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown from the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. Sources for above tables: Annual and Quarterly Estimates of the Canadian Balance of International Payments (67-201 and 67-001), Statistics Canada.

¹The unemployed as a percentage of the labour force for each region. Due to weighting differences, a simple average of the regional rates will not give the seasonally adjusted Canada rate on page 7, nor the unadjusted Canada rate in table 3. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. ³The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ⁴Includes miscellaneous manufacturing industries. ⁵Includes also publishing and allied industries. ⁶Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. ¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period of estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 2: manufacturing shipments¹ by industry based on the 1960 standard industrial classification (million dollars)

years and months	total shipments	non-durable	durable	foods and beverages	tobacco products	rubber	leather	textile	knitting mills	clothing	wood

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Total inventories owned by manufacturers including warehouse stocks.
Statistics Canada.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001).

Table 4: estimated value of shipments and unfilled orders in manufacturing industries, by economic use classification, based on the 1960 standard industrial classification (million dollars)

years and months		shipments						unfilled orders at end of month							
		consumer goods		machinery and equipment	con-struction materials and components	other inter-mediate goods and supplies	export-based industries	supplemen-tary clas-sification: auto-motive products	consumer goods		machinery and equipment	con-struction materials and components	other inter-mediate goods and supplies	export-based industries	supplemen-tary clas-sification: auto-motive products

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), Statistics Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included.

²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities.

³Includes appliances and utensils.

⁴Excluding shipments for re-processing at maker's own plant.

⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry.

Sources: Primary Iron and Steel (41-001), Statistics Canada.

¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

Note: The Farm Input Index replaces the Price Index Numbers of Commodities and Services Used by Farmers formerly contained in this table. A brief outline of the change is contained in the Note to Users in this issue.

Sources: Prices and Price Indexes (62-002), Index Numbers of Farm Prices of Agricultural Products (62-003), Statistics Canada.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Reports, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Sources: Retail Trade (63-005), Statistics Canada.

Table 1: value of retail trade by type of business and province, based on the 1960 standard industrial classification - concluded

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also *Credit Statistics (61-004)*. ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Installment financing components do not include interest and other unearned income finance charges. Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

Table 1: carloadings of revenue freight on Canadian railways¹ (thousand cars)

years and months		total railway revenue freight loadings (carload and non- carload) (000 tons)	total revenue cars loaded (carload only)	farm products and food					mine products					forest products		
				wheat	other grain and grain products	fresh fruits and vege- tables	other agri- culture products	animals and their products	prepared food products	iron ore and concen- trates	other metal ores and concen- trates	potash ²	coal, sand, cement and other mine products	lumber and plywood	pulpwood	other forest products

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Monthly averages for 1968 and 1969 may differ from the averages of the monthly data due to revisions which cannot be allocated by months. ³Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, Statistics Canada.

¹Includes Class 1 carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues. ³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services. Sources: Motor Carriers-Freight (53-005) quarterly, Passenger Bus Statistics (53-002) monthly, and Urban Transit (53-003) monthly, Statistics Canada.

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, Statistics Canada.

Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments. ²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical and Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitation services.

Sources: Canada Gazette and Dept. of Finance.

*Data for April to October are shown only where there is continuity from fiscal year 1970-71.

*March 1970 figures are preliminary in that they do not include supplementary accounts.

Planning and coordination of Statistical Programs in a Central Statistical Office — Continued from page 6

programs designed to make suppliers aware of the purpose of the surveys, and good questionnaire design, reflecting reasonable compromises to conform, as far as possible, to the accounting conventions of the responding firms. It also involves concerted efforts to minimize duplication not only within the statistical organisation but between the statistical organisation and other government departments.

A central statistical office is especially well-placed to promote coordination, reduce or eliminate duplication and contain the burden on respondents within reasonable limits not only at the federal level but at the provincial and other levels of government also. The recently enacted federal Statistics Act offers the provinces attractive arrangements for statistical collaboration and thereby avoiding duplication provided they meet certain standards. This is in addition to the hundreds of existing joint agreements involving the use of the same questionnaires, provided the respondent firms concur.

Instruments for Planning Integration

Among the user committees referred to above, a number have been set up to provide general guidance for an integrated and balanced development of statistics across a wide range of subject matter. However, a type of user body which does not as yet exist in Canada is a national advisory council advising the government or the statistical office on broad issues of statistical policy and planning.

To plan and implement an integrated system of statistics it is also necessary to create numerous interdivisional committees and task forces within the statistical office. Several of these will be referred to in the following discussion which, however, is devoted to a description of some specific instruments for planning and implementing an integrated system of statistics.

Standard Classification Systems and Central Registers of Business Reporting Units

Standard classification systems—of industries, commodities, occupations, regions and so on—are, of course, vital instruments for achieving statistical coherence in virtue of the fact that they are designed for classifying information from a wide range of sources (e.g., censuses of production, household surveys, censuses of population, surveys of capital expenditures, and so on) into identical categories, or classes. Their importance has always been recognized and hardly needs elaboration here. However, it is not always appreciated that uniform implementation and updating of the various classifications, in a changing world, is a continuous process requiring constant planning and negotiation with suppliers and users of the data. Statistics Canada has assigned full-time staff to this function. The location of this staff within the same central

agency which produces the data facilitates deeper penetration into the subject matter programs. Nevertheless the problems of uniform implementation have been very great and have required, almost invariably, much more planning, negotiation and coordination than anticipated.

In the case of the standard industrial classification, its implementation on a consistent basis, and the full coverage of the various activities without duplication, requires a comprehensive register of companies and their constituent reporting units with clearly defined and realistically structured boundaries. The development and maintenance of such a register is a complex matter, in part because the boundaries of the constituent reporting units of the same company for different statistical surveys (for example, payroll statistics and investment expenditures) may be different. Furthermore, they may differ for the same survey between different companies and for the same company and series for different points of time, for example monthly and annual data. Moreover, the boundaries of the various reporting units may change over time through internal reorganisations, amalgamations, and so on. Yet the implementation of a standard industrial classification is contingent on the existence of a set of unique and standard units. Compromises, involving negotiation with companies, are necessarily involved and these must be reflected in the central register. Of great importance in this connection is the setting up of consistent rules and documentation for defining the standard reporting unit and its constituents (usually the company and its establishments) as well as the deviations from them, for each survey. The implementation of these procedures facilitates the making of adjustments, where necessary, to render the statistics more comparable.

The vastness and complexity of the work involved has rendered computerization of a business register essential. Such computerization greatly facilitates, of course, the exploitation of the benefits the register provides. These include the following, in addition to improved coverage and more consistent classification in different surveys: a single source for deriving consistent sample frames and census lists; elimination of costs involved in preparing *ad hoc* lists; a framework for examining the nature and magnitude of response burden and the feasibility of eliminating duplicate collection of apparently similar statistics in different surveys; a framework for exploring problems of company-establishment statistics and the collection of establishment statistics at the company level; a focal point for the development of an interdepartmental register of business units. Such a computerized register is now in an advance stage of completion.

The System of National Accounts

In the sphere of economic statistics the national income and expenditure accounts have served in Canada, from their inception, as a planning and

coordinating instrument and as a framework for anticipating demands. This is also true of the extensions of the income and expenditure accounts—input-output tables, money flows, indexes of physical production, and the like. The balancing properties of the accounts and the facility they provide for tracing through the interrelationships of the various constituent components are of particular importance for these purposes. Many, perhaps most, of the series that have been thus improved or newly-created have been initiated as independent series in order to fulfill specific needs, but the fact that they could be used in, or in conjunction with, the various accounts and aggregates has provided added justification and a frame for appraising their relative importance and developing them within a coherent system. (2)

Where the national accounts are produced by the same central agency that is responsible for most of the statistical coverage of the country they can be used more effectively as a planning and coordinating instrument. Nevertheless, problems of reconciliation between the components and aggregates purporting to measure approximately the same or related phenomena persist. This is partly a reflection of the fact that with the cumulation of data and the development of extensions of the accounting framework, there are more components and aggregates to compare and to throw up discrepancies. In part it is due to imperfections in the raw data, and to lingering imperfections in communication among people whose decisions on classifications, definitions and methodologies are interdependent. The latter reflects the absence, as yet, in Statistics Canada, of certain formal integrating instruments such as standard dictionaries of concepts and definitions and of a comprehensive register of companies and its constituent reporting units, described above.

Furthermore, it is a reflection of the fact that, in the past, the orientation of the accounts was toward relatively few aggregative statistics. As a consequence, it was seldom necessary to carry through adjustments to the original questionnaires in order to effect reconciliation in the various components. At any rate, this was not really feasible on any large and systematic scale. With the contemporary emphasis on detail and flexibility for retrieving a large variety of aggregations, it is becoming an overriding objective to carry out, wherever possible, edits and reconciliations at the level of individual observations. This objective is becoming feasible through modern technology and statistical methodology, though much developmental work remains to be done. Thus, it should be possible in the future to reduce and control discrepancies more completely than in the past and to render the statistics more internally compatible. At the time of writing an internal committee is engaged in an extensive study to develop specific proposals for rendering the whole network of national accounts and related indexes, and the underlying primary data, more coherent.

New Instruments for Planning Integration and Flexibility

The growing recognition that the ultimate goal of government policy is the welfare of the population and the associated interest in issues related to the "quality of life" is reflected in the current quest for an integrated system of social statistics. This quest, which is carried out under the label of "social and demographic accounts" and "social indicators" has to face enormously more complex problems because certain prerequisites for the success of the national accounts are as yet largely absent in the social sphere.²

These difficulties do not detract from the importance of the quest which, in time, will undoubtedly influence substantially the content and composition of statistics in many fields. Some months ago an internal interdisciplinary task force was appointed to carry out an intensive examination of available information on social and economic aspects of individuals and families and the institutions serving them. This task force will identify data gaps, develop more effective integrating instruments, taking into account the work being done by international statistical agencies and those of other countries, and evolve long run plans for improvement in statistical coverage and analysis. A newly-established interdepartmental committee will provide guidance to this work.

To develop improved information for policy formulation and program evaluation it is useful also to harness more completely than in the past certain administrative information flows (especially those which have become available in recent years in virtue of new government programs such as medicare and pension plans) for joint use with data derived from surveys and censuses. This is particularly important in the social sphere where studies of the changes in certain characteristics and circumstances of people as they go through the life cycle are useful. It seems that the more complete utilisation of administrative records should play a more prominent role in the planning of statistical programs in the years ahead. However, there are risks in reliance on administrative records for statistical purposes, arising from unanticipated changes in legislation and administrative practices which have to be reckoned with. At any rate, in some cases at least, the administrative records would undoubtedly require considerable changes in

² We have in mind of course the absence of widely acceptable and comprehensive analytical underpinnings; the lack of *clearcut* national social goals which would be the counterpart of, for example, government responsibility for full employment and maintenance of high level of economic activity and the ensuing urgency for developing the information; the absence of a comprehensive common denominator as compared to the money market in an exchange economy in the economic sphere; and the unavailability of comprehensive and consistent documentation about many activities of the population in contrast with the accounting records of business and government.

content and design to be of value for statistical use. Statistics Canada is undertaking a comprehensive study of the more extensive utilisation of administrative records for statistical purposes.

The development of a flexible statistical service also involves flexibility in data collection to enable it to respond quickly to unanticipated requirements by users. This has involved a plan to

expand substantially its sample household-survey capability and to coordinate it with the decennial and quinquennial censuses of population and housing. It is anticipated that through such coordination the usefulness of the data collected in both the censuses and the sample surveys will be enhanced as will the capability for rendering special *ad hoc* services.

SECTION III. Resource Planning

Elements of resource planning have been touched on in the preceding section and we now turn to other aspects of resource planning.

Production Planning and Control

To provide quick and flexible service to users formal production planning and scheduling procedures are a useful instrument. It is planned in Statistics Canada to work out formal arrangements to facilitate the smooth flow of data through the organisation to achieve timely output and to utilize equipment and other resources as efficiently as possible. The need for such formal arrangements is particularly great in a large centralised statistical office where common facilities serve a large number of separate data flows. Some 680 separate statistical projects have been identified which, in varying degree must pass through such service areas as forms design, printing of forms, mailing, the computer and printing. Any one of these facilities can constitute a serious bottleneck to rapid processing. Involved here is the development of effective networks of scheduling, designed to facilitate synchronization of operations, eliminate bottlenecks and even out peakloads. It is expected that in developing production planning and control systems much can be learned from the experience of business firms.

To an increasing extent most production flows will pass through the computer which, as a consequence, can become a disconcerting bottleneck in executing production plans. We now turn to a discussion of some aspects of the impact of the computer on planning of statistical programs.

Computer and Related Manpower Planning

Successful planning involves perception of the implications of new technological (as well as intellectual) developments and in statistics the most important of these developments in recent years have stemmed from the computer technology. The impact of this technology on planning statistical programs, although already far-reaching, seems still to be in its early stages. A senior committee has been created to develop and guide the implementation of a plan for the phased and systematic automation of the statistical work of Statistics Canada.

Hardware Planning, the Integration of Statistics and Communication with Suppliers and Users

Hardware must be planned for sufficiently in advance, and with care, to avoid costly damage resulting from obsolete or insufficient equipment, and costly disruptions to operations arising from major changes in equipment. Such changes must be phased realistically and sufficiently in advance to ensure that current commitments are met even as the environment and procedures are adapted to the requirements of more up-to-date technology.

The planning of computer capacity has to be related with the planning of the statistical programs. This is no mean task since the computer requirements of the numerous statistical projects can only be forecast realistically after detailed forecast and analysis of the nature and scope of the projects. However, it would appear that a large central statistical office is helped by the law of large numbers: an analysis of a large variety of anticipated projects can result in a realistic forecast of *total* computer requirements. At any rate, such a planning exercise has been carried out successfully in Statistics Canada several years ago and the regular updating of this plan is getting underway.

Reference has already been made to the vast potentials opened up by the computer for flexible storage and retrieval and much of the planning of statistical programs should take place with a view to taking full advantage of these potentials. By the same token, the computer technology provides a powerful influence for unification of the whole network of processes involved in the production and analysis of the statistics because a prerequisite for the proper utilisation of the computer technology is the necessity for spelling out, codifying and standardising concepts, classifications, procedures and so on. This is conducive to a more complete integration of data from various surveys, facilitating joint or interrelated use of information from various sources. The payoff of this is particularly great in a large central organisation covering a comprehensive and wide range of statistical information but it is not an easy matter to achieve.

The computer technology is necessitating more extensive planning for establishing effective arrangements with business and government suppliers of information who have automated or are planning

to automate their operations. A small group is being created for this purpose. Clearly, future planning will aim not only to take advantage of the opportunities afforded by the automation of suppliers of data and to minimize the ensuing problems, but as well to establish various modes of serving users quickly and effectively through further development of general retrieval systems requiring no or little programmer intervention, remote terminals and the like. In this process, relationships with users will undoubtedly assume new characteristics.

The Computer and Manpower Planning

The computer has also added a new urgency to manpower planning. Contrary to expectations, with increasing automation the human element looms larger in importance. Moreover, while the "machine" component can be purchased outside the "man" component must be, in the main, nurtured inside.

The computer imposes much more detailed and comprehensive advance planning in the specifications of survey design, data inputs, processing and outputs. Furthermore, the computer has introduced major economies in carrying forward the statistical production process to include various ratios, regressions and a multitude of analytical operations. The development of large projects therefore, involves interdisciplinary participation from the outset to ensure that the right considerations are taken into

account and are included in the specifications. Thus, it is necessary in the appropriate phases of the statistical process, to envisage, more than in the past, the use of the skills of the mathematician, demographer, econometrician, as well as those of the subject matter expert and computer analyst and programmer.

The buildup of these relatively scarce skills and their blending into interdisciplinary teams requires careful planning. Furthermore, suitable training programs must be planned and implemented to fill gaps in the background of personnel resulting from technological change. Statistics Canada is developing training courses, on the one hand, for its computer systems analysts and programmers and, on the other, for subject matter and other staff. The latter include computer appreciation courses as well as courses on user-oriented general computer programs.

Manpower planning is also involved as more work is transferred to the computer and as an increasing degree of functional specialisation evolves. In this process personnel with subject matter background can look forward to getting more time for analysis and evaluation of the statistics, problems of users and suppliers, research and more effective planning of reliable and relevant statistical programs.

SECTION IV. Planning Methods

We now turn to a discussion of planning methods, in particular those associated with PPB. In adopting systematic planning machinery there is a danger of becoming preoccupied with its formal manifestation. In its extreme form, the illusion may be created that one is "doing PPB" by simply going through certain motions in methodical detail. It must not be forgotten that the creative aspects of planning may not be amenable to the orderly and automatic dictates of any planning system. As Anthony has put it, "problems, opportunities and bright ideas do not arise according to some set timetable; they have to be dealt with whenever they happen to be perceived". (1)

Keeping in mind the wisdom of this message, our limited experience to date suggests that the approaches underlying PPB may yield important payoffs, painful though the process of accommodation to the system may be. Hopefully, it should help improve the quality of our decisions.

The question of appropriate objectives for a statistical system, and particularly of an optimum mix of activities for their attainment, is a long standing and fundamental concern of subject matter planning. There can be little doubt, however, that the steady insistence of our own Treasury Board that departmental priorities should reflect explicit

analysis of the costs and benefits of alternative program possibilities tends to inject a greater note of realism and discipline into what might otherwise drift towards "blue sky" planning. Even though the classic illustrations of cost-benefit analysis lie in the engineering field, and seem far removed from statistics, "it can be argued that the very process of stepping through the analysis will be of great value to the decision maker". (3)

However, meaningful analysis can only be made if the necessary information on costs and benefits is available. The inadequate nature of the information on the costs (financial and manpower) of its statistical projects was a matter of concern in Statistics Canada long before their significance in the PPB cost-benefit context was fully appreciated. In the past, it was extremely difficult to answer questions such as, "how much do you spend on this or that statistical project", particularly when the relevant activity cut across organisational boundaries, as most indeed did. The availability of output-oriented cost records on a historical and current basis (including planned as well as actual cost), is a prerequisite not only for the cost-benefit analysis underlying priority determination but for the planning of future resource requirements. When used in conjunction with information on the progress of various developmental projects and the timeliness of reports in relation to target dates, such

data also provide a means of monitoring resource utilisation during the implementation cycle of a plan.

A project information system has recently been developed in Statistics Canada which is designed to meet these requirements. However, one element of cost is excluded from this system, namely the burden on respondents. This vital element must be weighed carefully in the analysis and the process of priority setting even though it is not, as yet, measured explicitly.

Although, with the exception noted, the costs of statistical projects can be identified and measured, at least approximately, this is rarely the case with their benefits. The problem here arises from two main factors. First, the fact that statistics are intermediate products not end products. The benefit of a statistical series is a function of its impact on policy decisions and their importance; it is generally very difficult to pin it down and attach a value to it. Secondly, the process of identifying benefits is all the more difficult to the extent that the series is part of a system in which the diverse elements are interdependent and the value of each is enhanced by the availability of the others, and in the degree to which the same series is used by a variety of users and for a variety of purposes.

Thus national priority setting and budget allocation in statistics is extremely complex. Difficult choices must be made between subject matter programs, the benefits of which cannot be compared, e.g., the balance of payments and crime statistics. Furthermore, choices must be made between strengthening the infra-structure to support subject matter objectives some years hence and more immediate extension of surveys in various fields. These difficulties do not detract from the need to analyse benefits, along with costs, to render priorities and the corresponding budget allocations as rational and balanced as possible. Judgment and insights based on the best experience and information derived from the various arrangements and activities described in Part II, will continue to play a decisive role. Attempts at systematizing this process can never circumvent its essentially subjective character. However, by making more explicit the factors which influence the benefits of statistical proposals and by looking at alternative ways of assessing their relative importance, the quality of judgment might be significantly improved. The resultant priorities should, accordingly, be more consistent and defensible.

Pricing is raised as an alternative approach to priority determination with sufficient frequency that it deserves specific mention. In some cases the sale of statistical services replaces, in part, the appraisal of benefits by analytical means. Statistics Canada makes some use of a sale-of-service system which is financed through an extra-budgetary revolving fund and is planning to extend this practice in some degree. However, the scope for these arrange-

ments is limited to specific services or series for specific users. A great deal of widely-used data, such as the consumer price index, productivity indexes, the national accounts, the balance of international payments simply could not be priced rationally. Where the professional and managerial skills in the statistical system are scarce, charging for a service may not curtail demand to the necessary degree and may distort the system away from a pattern which is in the public interest.

The Annual Planning and Budgetary Cycle

Review and approval of the Statistics Canada program calls at present for the preparation of a three-year (until recently, a five-year) program forecast each spring. Following a set of guidelines distributed by the Chief Statistician of Canada, program proposals, originating in the various responsibility centres, are submitted to his office through normal reporting channels, together with appropriate justification. After study of their total impact and discussion with the responsible officers, they are amended in the light of priorities which, as indicated before, are at present based on largely subjective and general considerations. The sum of these separate (though interdependent) budgets may appear larger than can be realistically digested, in which case the increment is adjusted to a rate of growth consistent with the absorption capacity of the agency. Invariably, there is more optimism reflected in what divisions feel they can do in the early years than in the later years of the forecast period.

Following study by Treasury Board officials and discussion with them, a global figure is determined for the first year of the period which then forms the basis for a detailed budgetary exercise in the fall. This figure invariably falls somewhat short of expectations, but has nevertheless been sufficient in recent years to permit a reasonable rate of growth for most portions of the program.

Typically, so far, this has been a seasonal activity, which became progressively more hectic as deadlines approached, and in which matters of form and presentation tended to obscure substantive issues unless great care was exercised. We are currently attempting to develop approaches and machinery which will replace this pattern by continuous procedures rooted in a more thoughtful concern with the longer term. A major instrument to this end is expected to be a "project proposal" procedure by which material for potential inclusion in future program forecast submissions can have its genesis at any time of the year and be developed in progressively more detail as it survives successive screenings. The envisaged project proposal procedure will be a substantial improvement of the one which has been in use for some years.

Another weakness of the present program forecast procedure has been that insufficient time could be devoted to a systematic and searching review of ongoing activities. It is clearly not possible, and

probably not even necessary, to carry out a complete review of every part of the program each year, but a rotational procedure by which every major program activity is critically evaluated at, say, three or four year intervals, would be an extremely helpful device in promoting optimal use of resources.

For these and other planning procedures to be fully effective, they must operate in the context of explicit objectives. It is planned to formulate a more explicit set of departmental objectives to provide more effective guidance for the setting of priorities and evaluating activities. A statement of meaningful and operational objectives which are to guide medium-term planning activities cannot, of course, be unilaterally promulgated by the senior management but must draw upon informed views in

all parts of the organisation and fed by the various vehicles described in Part II.

In this manner, it is hoped that the detailed annual forecasting and budgetary submissions called for by the Treasury Board will assume a different significance. Whereas their preparation has hitherto represented an uneasy mixture of hurried thinking about policy and seemingly bureaucratic budgetary calculations, it should be possible, in time, to treat them simply as a planning tool for translating subject matter program intentions into statements of future resource requirements, keeping in mind that the financial budget is merely one, albeit a very important one, of a number of constraints in achieving subject matter and resource plans.

SECTION V. Concluding Remarks

We have attempted to describe some selected aspects of a very broad and varied topic and to place the discussion in a setting of a centralised statistical office confronting issues of the medium-term. We have indicated that typically subject matter plans take the form of specific responses to specific, seemingly unconnected, demands, and described the major vehicles for acquiring knowledge needed in a statistical office to plan the subject matter and to anticipate needs. We have emphasized the importance, in planning statistical programs, of taking into account the essentially unified character of the statistical system and outlined some of the instruments used for planning and implementing a flexible and integrated system of statistics in which the various parts are mutually coherent. We have also indicated some of the problems involved in reaching this goal. We have mentioned, briefly, various elements contributing to the efficient creation of the statistical end-product and pointed to some directions a modern statistical service should take in order to satisfy contemporary needs for statistical information. We then turned to a discussion of planning methods in which we stressed the need for comprehensive information on costs of projects, the difficulty of measuring benefits and, notwithstanding that, the importance of taking an analytical approach to priority setting. Finally, we have dealt with some considerations relating to budgeting as an element of planning the longer term statistical program.

The many-sided character of our topic is reflected in the variety of considerations covered in the paper. Nevertheless, we have omitted a number of vitally important issues, for example, the need to develop synchronized plans for major revisions and earlier release of information. Another serious omission relates to follow-up procedures, that is, those required to determine whether managers have achieved the intended targets with the resources placed at their disposal and the factors responsible for deviations from plans. Nor have we dealt with the implications of budgeting and other uncertainties.

We have treated inadequately a number of issues that we have covered. Those relating to manpower warrant elaboration in these concluding remarks. We noted that planning in a statistical office must take into account the fact that, in contrast with machines, the human element must be nurtured inside the organisation. Beyond that, planning should have as one of its major aims, the development of an environment which attracts and holds competent and creative people. This is essential if the statistical office is to succeed in achieving the objective of satisfying contemporary needs for good, prompt and relevant statistical data. We have mentioned, as an element of such an environment, the setting up of training courses designed to update human skills in a situation of rapid technological change. The courses we mentioned, while indispensable, are in fact merely part of a more comprehensive training and career development program which should include, as well, management courses, arrangements for paid educational leave and a reasonable degree of job rotation. While Statistics Canada has made some progress along these lines, the road ahead is still substantial.

Another element in the creation of a suitable environment is the development of a climate of freedom from excessive constraints and niggling administrative diversions. Included here is suitable accommodation, facilitating communication between people working in related fields, because, in a real sense, the integration of statistics is contingent upon the "integration of statisticians".

A statistical agency, centralised or decentralised, is at once a scientific and production organisation. Its activities are directed towards the development of new information, analysis of available data and rendering more efficient and less costly and more timely the statistical production process. The process of producing reliable and relevant statistics involves many intellectually

challenging activities. Nevertheless, the statistical office must cope with the fact that, in general, the work of producing statistics is less appealing to professional people than that of using them. The attractiveness and effectiveness of the statistical organisation is enhanced when strong unifying influences pervade it, when an awareness of the interdependence of the activities of individuals in the various parts of the organisation prevails, when the organisation is imbued with a receptiveness to technological and methodological innovations, and when decisions take the form of *conclusions* arrived at after objective evaluation of all relevant factors. An atmosphere of intellectual freedom should prevail in the organisation, conducive to free inquiry while, at the same time, emphasizing practical results and

the efficient utilisation of scarce resources. The presence in the organisation of interdisciplinary groups is conducive to intellectual stimulation and effective cooperation. It is also essential to evaluate, with penetration and authority, the practicability as well as the importance of the emerging intricate and massive demands for statistics and efficient strategies for meeting them. Such an atmosphere is conducive to officials at various levels of responsibility making good decisions and for attracting and keeping people capable of making such decisions. Its creation is of vital importance in the effective planning, coordination and implementation of relevant and reliable statistical programs that are essential for developing and evaluating future economic and social goals.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 3, Table 3.1—Financial Flows Matrix

The National Income and Expenditure Accounts revisions result in some conceptual and statistical changes to the Financial Flow Accounts. Revised data for the Financial Flow Accounts are not comparable with those of earlier periods which do not reflect these changes. For details of these revisions see *National Income and Expenditure Accounts, 1926-68*.

A new publication of the historical quarterly series for all sector and category tables, and annual matrices covering the first quarter 1962 onwards, is expected to be released in 1972.

Data for the third quarter 1971 are published in the present issue of the Review. Supplementary tables covering revised third quarter 1970 and 9 months ended September 30, 1970 and 1971 appear on pages 114-119 of this issue.

Section 6, Table 1—Inventories, Shipments and Orders

All seasonally adjusted data in these tables have been revised from January 1968. Revised unadjusted data were published in the January issue of this Review.

The data published here are the first to be based on the 1969 Census of Manufacturing. Revisions to data also reflect adjustments to the 1968 Census for Transportation Equipment industries. The final estimates for the years prior to and including 1969 have been adjusted to the Census for each year. Monthly values subsequent to 1969 are projections and are subject to further revision when more Census data become available. More detail will be available in *Inventories, Shipments and Orders in Manufacturing Industries* in Catalogue 31-001 for October, 1971.

Section 6, Table 13—Production of Sawm Lumber

The monthly series "East of the Rockies" has been deleted as it is considered to be misleading. Data are available on an annual basis only for Prince Edward Island, Newfoundland, Manitoba, Yukon and the Northwest Territories.

Section 10, Table 3—Wholesale Sales

All monthly and annual wholesale trade data from 1961 forward have been revised to the 1966 Census and will be published shortly in *Wholesale Trade 1961-1970*, Catalogue 63-521. Information is now available on request from the Merchandising and Services Division.

Section 10, Table 6

Consumer Credit figures are revised to reflect the changes occurring in Sales Finance and Consumer Loan Companies.

THE 1971 CENSUS OF MERCHANDISING AND SERVICE BUSINESSES IN RELATION TO AN INTEGRATED SYSTEM OF NATIONAL ACCOUNTS

E.P. Cannon and I.E. Altman*

I. Introduction

The forthcoming Census of Merchandising and Service Businesses represents the final phase of the *1971 Census of Canada*, the major part of which took place in June 1971. Unlike the first three phases (population, housing and agriculture), however, the business census cannot be conducted until early in 1972—since it attempts to measure actual business activities over a **complete** financial year.

The merchandising and services census is the "baby" of Canada's census family. In contrast with the censuses of population, housing and agriculture, which have been carried out regularly since 1871, the first attempt to survey Canadian businesses on a full-coverage basis was not made until 1931. A similar survey of wholesale, retail and service businesses was repeated in 1941, 1951 and 1961—and each time the scope and coverage of the census were broadened in response to the growing information needs of the economy.

A new development in the census program occurred following the 1961 Census of Canada. In 1955, the government had issued an order-in-council extending the quinquennial (or mid-decade) census—previously limited to the Prairie Provinces—to embrace the entire country. As in the past, however, only population, housing and agriculture were included. Ten years later, the government agreed that the pace of business activity was accelerating at a sufficiently rapid rate to justify a more frequent measurement than once every ten years. A census of merchandising and service businesses was included, for the first time, in the 1966 schedule.

The purpose of the business census is essentially two-fold: first, to provide a wide range of users—both within government and outside—with an extremely detailed picture of what is going on at a fixed point in time in the distributive and service trades; and second, to serve as a benchmark for a broad program of inter-censal surveys covering the same areas. It was in recognition of these important purposes that planning for the 1971 Census of Merchandising and Service Businesses began nearly three years ago—in April 1969. In the intervening period, concepts and definitions have been finalized, work has proceeded on the automation phases of the census, and the colour-coded census questionnaires—more than 300,000 of them—will begin to flood Canada's postal system around February 15, 1972.

This article will concern itself with three specific aspects of the 1971 Census: (1) the census in relation to an integrated system of national accounts; (2) concepts and definitions; and (3) the impact of automation on the census.

II. What is an Integrated System of National Accounts?

Since statistical series are usually used with other statistical series, seldom in isolation, they must be constructed as an integrated part of a mutually consistent overall design. The importance of integration in statistics has been recognized in Canada for many years. In the realm of economic statistics unquestionably the most notable development in Canada, and indeed in other countries, has been the construction of a regular set of national income and expenditure accounts. These accounts have had a profound influence on the demand and utilization of economic data and hence on statistical programs in general.

Closely related to the contribution of the accounts to economic analysis is their contribution to the anatomy and content of the system of economic statistics. Since the concepts, definitions and major category and sector distinctions of the accounts stem from the requirements of economic theory and practical economic analysis, the implementation of the accounting system has led to the adoption of more consistent and meaningful definitions and distinctions in the primary data. They have provided an integrated quantitative framework for appraising existing information and for evaluating gaps, inconsistencies and other imperfections in the data. More recently other related statistical accounting systems—in particular input-output, financial flows, production and productivity—have been constructed, with similar beneficial effects on the utilization, analysis and integration of statistics.

III. A "Birds-eye" View of Some of the Major Components of an Integrated System of National Accounts

The production, distribution and financing of the nation's output of goods and services involve countless transactions. These transactions consist of buying and selling goods and services; hiring labour, investing capital, discharging debts, and renting property; paying taxes, receiving pensions, giving gifts, etc. The records of such transactions, some of which will emanate from the data collected by the 1971 Census of Merchandising and Service Businesses, form the basis for producing numerous

* E.P. Cannon is Chief, Integration and Response Analysis Section, Merchandising and Services Division; I.E. Altman is Chief, Research and Development Section, Merchandising and Services Division. The authors acknowledge with gratitude the assistance of F.R. Thomas, Chief, Quinquennial Census Section, Merchandising and Services Division, Miss A.E. MacLaren, Computer Systems Development Division, and others, in the preparation of this article.

statistical series. However, these series must be summarized into a limited number of significant categories in order to provide a manageable and useful picture of the structure and functioning of the economy as a whole and its major parts. Those statistical summaries which rely on the 1971 Census of Merchandising and Service Businesses for information on the retail, wholesale and service industries of the economy, are briefly described below:

(1) The National Income and Expenditure Accounts —

The statistical statements produced contain totals and sub-totals such as: the gross national product, the national income, personal income, personal saving, gross national expenditure, government expenditure on goods and services, personal expenditure on consumer goods and services, domestic investment, and so on.

The various totals and sub-totals are presented in accounting formats which are accordingly referred to as the "National Income and Expenditure Accounts". Separate income and expenditure accounts are constructed for four major sectors of the economy, as well as for the economy as a whole: all persons, all businesses, all governments, and all transactions with non-residents.

The various components of the accounts are further subdivided into as many industry, commodity and regional aggregations as the available statistics permit. The expenditure components are adjusted for changes in prices.

A major use of the income and expenditure accounts is in the field of economic public policy as they provide basic background information on the state of the economy as well as an integrated structural system within which specific proposals can be examined and tested for consistency. The accounts also provide the business community and the general public with a set of tools for analyzing the course of economic events within a quantitative framework. The presentation of the statistics in the accounts is such as to demonstrate the interdependence of economic events, thus greatly facilitating economic analysis, consistent projections and the building of economic models; they demonstrate that wages are a cost of production as well as income which permits purchases; that taxes are at once expenditure (to the taxpayer) and revenue (to governments); and so on.

(2) Input-output tables — An important extension of the income and expenditure accounts are the so-called input-output tables. These tables are designed to show the sales of specific industries to all other industries and the consumption by specified industries of goods and services produced in other industries. The tables also show how much consumers and governments have purchased from the various specified industries and how much was exported by these industries. By providing a detailed integrated picture on the

structure of inter-industry relations such tables provide basic information for studying the ramifications of economic pressures and events which have their first impact on a particular point of the economy.

(3) National production and productivity indexes —

An altogether different summary arrangement of statistics takes the form of indexes of production of various industries. The best known of these indexes is the monthly index of industrial production which is one of the major sensitive indicators of current economic activity. The procedures used in constructing the index of industrial production have been extended to cover all industries of the national economy. The changes in this over-all index, which correspond to the changes of an index of gross national expenditure adjusted for price change, provide an up-to-date picture of the changing industrial composition of national output. Together with suitable statistics on labour employed in production, the output figures are used in the construction of productivity indexes. Vitally important inferences regarding the functioning of the Canadian economy are frequently made on the basis of these indexes.

IV. How Does the 1971 Census Satisfy the Requirements of an Integrated System of National Accounts?

This section articulates the manner in which the Merchandising and Services Division of Statistics Canada is satisfying most of the requirements of an Integrated System of National Accounts in relation to the retail, wholesale and service industries of the economy. It is the hope of the authors that this section will answer the question most often asked by respondents to Statistics Canada surveys—**who uses the data we provide, how and why?**

The accompanying table outlines the contents of the various questionnaires, the user divisions within the framework of the system of National Accounts and the manner in which they use the data. The following definitions, derived using the "eclectic approach", are numbered to correspond to the references in the table:

(1) Personal expenditure on consumer goods and services — this figure accounts for in excess of 60% of gross national expenditure and is composed primarily of data collected on the retail and service industries.

Personal disposable income (personal income less direct taxes) less personal expenditure on goods and services equals personal net saving.

(2) "Make" matrix — shows the distribution by commodity of the output of each of the industries and, in each column, the distribution by industry of the output of each of the commodities. In other words this matrix shows the market shares of commodity production by industries.

(Continued on page 120)

RESPONSES TO STATISTICAL REQUIREMENTS: THE TRAVEL INDUSTRY

R.A. Chadwick*

There exists a travel "industry" which is recognized by its participants and which creates demands for an adequate data base to meet its requirements. In the Department of Industry, Trade and Commerce, for example, the Travel Industry Branch is a wing of the Office of Tourism which coordinates federal activities and participates in programs designed to aid the growth and development of the industry. The Travel Industry Association of Canada is a large trade association for the industry. Further, in several provinces there are departments or branches of Travel Industry, all of which have agencies for tourism.

For purposes of statistics, however, Statistics Canada cannot recognize a travel industry because it is not separately identified and its elements cut across the lines of the Standard Industrial Classification (SIC). The United Nations Conference on Trade and Development (UNCTAD) identified the same problem in relation to the United Nations Standard Industrial Classification of All Economic Activities. A recent UNCTAD report¹ described the "tourist sector" as follows: "It can be broadly conceived as representing the sum of those industrial and commercial activities producing goods and services wholly or mainly consumed by foreign visitors or by domestic tourists. (In some cases, they also provide services to departing residents.)" This statement corresponds closely to the author's view of travel, which in S.I.C. terms, is a series of related consumption activities of travellers that create a demand for goods and services identified in a wide range of S.I.C. classes. These include classes in S.I.C. groups such as Accommodation and Food Services, Transportation, Trade, Public Administration, Construction, and several manufacturing groups.

This scattering of the constituent elements of the travel industry in the S.I.C. and in the Statistics Canada organization, made it very difficult for users of statistics to find data related to the "industry". In addition, there was until two years ago no central responsibility for contacts or for improvements to the data base. The Federal-Provincial Conference on Economic Statistics formally recognized this situation, in 1967, in resolutions which called for establishment of a focal point (in Statistics Canada) for travel statistics and a review of the procedures for obtaining information on international travel and participation in domestic travel and recreation surveys (by Statistics Canada). These resolutions were reinforced by recommendations and resolutions from other conferences held at approximately the same time.

* Mr. Chadwick is Assistant Coordinator (Travel), Provincial Liaison and Consultative Services, Statistics Canada.

¹ *Guidelines for Tourism Statistics*, UNCTAD, Secretariat, United Nations, New York, 1971 - p. 30.

Statistics Canada's response included sponsoring a study by Professors Wolfe and Ellis on the requirements for Outdoor Recreation and Tourism Statistics;² participating in the Canadian Travel Survey, which is primarily concerned with domestic travel; a review of the international travel series; extension of the Accommodation Survey; and establishment of a unit to serve as the focal point for travel in the Socio-Economic Statistics Branch under the Coordinator, Provincial Liaison and Consultative Services. The remainder of this brief article examines the work of this new unit.

In its two years of operation, the Focal Point has acted on several recommendations contained in the Wolfe-Ellis Report and is exploring further possibilities in this general area.

A variety of tasks have been undertaken in cooperation with bureau and other staff which are grouped for convenience under the following headings:

1. User Services
2. Survey Development and Review in Statistics Canada
3. Federal Coordination
4. Canada-wide Coordination.

1. User Services

An early project under this heading was the preparation of a bibliography of TTOR³ statistical sources in Statistics Canada which is constantly being updated. The main product is a new Statistics Canada annual publication, *Travel, Tourism and Outdoor Recreation - A Statistical Digest*, of which the first edition is scheduled to be released early in 1972. Although its main purpose is to provide the key data required by TTOR users in a single volume, the Digest will have other important secondary values such as, for example, the identification of statistical gaps and anomalies which require further attention by Statistics Canada. It will also serve as a users' reference for defining other requirements for additional or alternatively arranged information.

2. Survey Development and Review in Statistics Canada

Two major roles of the Focal Point in this context have been "subject-matter" representation on the project team directing the large household sample survey of domestic travel (the 1971 Canadian Travel Survey) undertaken by Statistics Canada on behalf of the Office of Tourism, and user liaison in the advisory committee for the redevelopment of

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2, 3)

THE SEASONALLY ADJUSTED INDEX OF INDUSTRIAL PRODUCTION DECLINED BY 0.3% IN NOVEMBER TO A LEVEL OF 181.1 FROM 181.7 IN OCTOBER. ALL THE DECLINE CAME FROM MANUFACTURING. DURABLE GOODS MANUFACTURING OUTPUT DECLINED AND THE OUTPUT OF NON-DURABLE GOODS REMAINED UNCHANGED. THE PRODUCTION OF BOTH MINING AND UTILITIES INCREASED.

		manufacturing (1961=100)				(1961=100)

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

RETAIL SALES IN NOVEMBER INCREASED 2.0% ABOVE THE OCTOBER LEVELS. THE LARGEST INCREASES WERE REGISTERED IN SERVICE STATIONS AND GARAGES (12.5%) AND WOMEN'S CLOTHING STORES (9.9%). OF THE FIVE TRADE GROUPS REPORTING MODEST DECLINES IN SALES MOST NOTABLE WERE SHOE STORES (3.5%) AND HARDWARE STORES (3.1%).

NEW MOTOR VEHICLES SALES CONTINUED AT A HIGH LEVEL EXCEEDING THOSE OF NOVEMBER 1970 AND NOVEMBER 1969, THOUGH THEY HAVE DECLINED FOR THE SECOND CONSECUTIVE MONTH. SALES OF COMMERCIAL VEHICLES ARE EXCEPTIONALLY STRONG, THOUGH marginally lower than last month. CANADIAN AND U.S. PASSENGER CAR SALES WHICH HAVE SHOWN RECENT SIGNS OF RECOVERING ARE STILL BELOW THE NOVEMBER 1969 LEVEL.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts.

²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between recorded measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown from the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. Sources for above tables: Annual and Quarterly Estimates of the Canadian Balance of International Payments (67-201 and 67-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. Source: The Labour Force (71-001), Statistics Canada.

¹See footnote 1, table 3. Labour force obtained as the sum of employed and unemployed from tables 5 and 7. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force (71-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below.²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. Source: Employment and Average Weekly Wages and Salaries (72-002), Statistics Canada.

¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review. ³Indexes for Quebec City and Thunder Bay are on the (1969=100) base. Source: Prices and Price Indexes (62-002), Statistics Canada.

Table 1: total inventories, shipments and orders in manufacturing based on the 1960 standard industrial classification (million dollars)

years and months		inventory at end of month									
		shipments ¹	new orders received during month ²	unfilled orders of end of month	owned ³	held but not owned	all inventory held				ratio of inventories owned to shipments
							total	raw materials	goods in process	finished products	
unadjusted for seasonal variation

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Sources: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

See note to users.

Table 2: manufacturing shipments¹ by industry based on the 1960 standard industrial classification (million dollars)

years and months	total shipments	non-durable	durable	foods and beverages	tobacco products	rubber	leather	textile	knitting mills	clothing	wood

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. ¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), Statistics Canada.

¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of costings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, notional defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing at maker's own plant.

⁵Data on shipments of steel shipes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), Statistics Canada.

¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted.
²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. ¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), Statistics Canada.

Table 1: value of retail trade by type of business and province, based on the 1960 standard industrial classification - concluded

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also *Credit Statistics* (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Instalment financing components do not include interest and other unearned income finance charges. Sources: *Consumer Credit* (61-004), Statistics Canada; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11.²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months.³Includes special transaction-trade, not shown separately.⁴Includes scrap.⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Includes traffic interchanged between Canadian railways.

¹Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues.

³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services.

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

¹Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bands without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. ²Total new settled-for ordinary sales in Canada. Total sales figure does not include sales for Northwest Territories. ³Under new or amended contracts. ⁴Revisions for 1970 are preliminary. ⁵Source: Monthly Survey of Life Insurance Sales in Canada, Life Insurance Agency Management Association, Hartford, Connecticut, U. S. A.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, Statistics Canada.

Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments. ²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical and Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitation services.

Sources: Canada Gazette and Dept. of Finance.

*Data for April to November are shown only where there is continuity from fiscal year 1970-71.

*March 1970 figures are preliminary in that they do not include supplementary accounts.

Responses to Statistical Requirements: The Travel Industry - Continued from page 6

international travel statistics. The Unit has also assisted in the redevelopment and expansion of the series on hotel accommodation, and in extension of the 1971 Household Facilities and Equipment Survey to include recreational items. In the course of preparing the Statistical Digest relevant data have been identified in a number of Statistics Canada series, notably transportation, manufacturing, merchandising and services. Other important sources of TTOR data being exploited are the *1969 Family Expenditure Survey*, the *1971 Census of Housing*, and *1971 Census of Merchandising and Service Businesses*. While all of these produce substantial quantities of data related to TTOR, the programs had already been fully developed when the focal point was established. Areas currently receiving attention include employment, conventions, bus travel and domestic ferries.

3. Federal Coordination

A major activity in this area is liaison with federal users and producers of TTOR related data. About 20 of these, with different degrees of involvement, are represented in the Interdepartmental Committee on Travel/Tourism/Outdoor Recreation Research which meets twice or three times a year. Through the committee sub-groups, and by individual contacts, Statistics Canada is striving for better coordination of surveys, and avoidance of duplication of activities at the federal level.

4. Canada-wide Coordination

The Focal Point provides the Secretary for the Travel Research Planning Committee and also for its more active Technical Sub-committee (both under the aegis of the Federal-Provincial Conference on Tourism). These organizations provide continuing contacts between key travel research personnel in the federal, provincial and private sectors.

The regular meetings of the Technical Sub-committee facilitate coordination of research activities. One developing product of the sub-committee under the leadership of Statistics Canada is a series of definitions for travel research. So far, definitions and classifications have been published for travellers and traveller accommodation. Work is currently proceeding on a classification of socio-economic characteristics related to travel and on travel characteristics such as purpose of trip, mode of transportation, activities engaged in, length of stay and items of expenditure.

This note is intended merely as an indication of the main activities of the Statistics Canada's focal point for travel during the past two years. Directions for development in the future have not yet been solved, but it is anticipated that activity by Statistics Canada in the TTOR-Leisure area will accelerate in response to user demand.

The 1971 Census of Merchandising and Service Businesses - Continued from page 5

(3) **Value of physical change in inventories** - the net change during the year of business holdings of inventories must be included in the gross national expenditure in order to allow for that portion of current production (purchases) which has not yet been sold (positive change in inventories), or to eliminate that portion of previous years' production (purchases) which is included in sales of the current year (negative change in inventories). The change in the value of inventories relevant to gross national expenditure should reflect a change in physical volume valued at the average market prices of the period. This change is referred to as the value of the physical change in inventories.

(4) **Inventory valuation adjustment** - since inventories often contain goods produced (purchased) in previous years, an adjustment of book values is necessary to allow for the valuation of the carry-over portion. To make this adjustment, it is necessary to estimate the commodity content of inventory holdings, the normal turnover period for the industry, and the accounting methods used by the firms in arriving at book values. The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at

average prices of the current period to obtain the value of the physical change. The inventory valuation adjustment is the difference between the value of the physical change and the change in book value. This adjustment is made to the National Income to remove, from corporation profits and the net income of unincorporated businesses, any inventory gains or losses arising from the effect of price changes on the holding of inventories.

(5) **Census value added** - is a concept which evolved from the Census of Manufactures as a measure of output applied to an industry. It is obtained by deducting from the value of gross output in a period, the value of materials used, the cost of light, heat and power, the cost of goods purchased for resale and some service expenses. An approximate equivalent in the retail, wholesale and service industries is "mark-up on sales" which is the difference between sales and the purchase price of goods sold in a period.

(6) **"Absorption" matrix** - shows the distribution by industry of the input of each of the commodities and, in each column, the distribution by commodity of the input of each of the industries. In other words this matrix shows the distribution by in-

Users Within the Framework of a System of National Accounts

Data requirements included on questionnaires	National income and expenditure accounts	Input-output tables	National output and productivity	Prices and labour
I. Sales and other outputs Includes breakouts of sales of new goods purchased for resale, sales of used goods purchased for resale, sales of goods of own manufacture, receipts from sales of meals and lunches, labour receipts from repairs and services, gross commissions earned, interest, rent, etc.	Measurement of personal expenditure on consumer goods and services—GNE (1)	Measurement of personal expenditure on consumer goods and services (1) and used in "make matrix" (2)	Provides "gross output" of the industry being measured	—
II. Inventories Including opening and closing, broken down into new and used, in addition to basis of valuation.	Measurement of value of physical change in inventories—GNE (3) *Inventory valuation adjustment—GNI (4)	Measurement of value of physical change in inventories (3) Inventory valuation adjustment (4)	To adjust cost of goods purchased to derive gross margin Inventory valuation adjustment (4)	—
III. Gross trading margin Total net sales and receipts less cost of goods sold.	—	Used in "make matrix" i.e., production table or output table (2)	Gives approximation of "census value added" (5)	—
IV. Expenditures				
(i) Materials and supplies —includes breakouts of goods purchased for resale in same condition as purchased; raw materials; heat, light, power and water; office and miscellaneous supplies.	—	Used in "absorption matrix" i.e., input table (6)	To adjust gross trading margin to more closely approximate value added (7)	—
(ii) Expenditure on services —includes breakouts of communications (telephone, telegraph, telex, postage); gross rent paid for land and buildings; gross rent paid for motor vehicles, machinery and equipment; purchased delivery services; purchased advertising and sales promotion; purchased repairs and maintenance; purchased legal, auditing and other professional fees; insurance; royalties, franchise and voluntary group fees; interest and bank charges.	—	Used in "absorption matrix" i.e., input table (6)	To adjust gross trading margin to more closely approximate value added (7)	—
(iii) Other expenditures (a) Indirect taxes (taxes, permits and licences (property and business)) (b) Depreciation	*Used to calculate GDP at market prices (8) *Component of GDP at factor cost (9)	Used to calculate GDP at market prices (8) Absorption matrix and GDP (6)	— Component of GDP at factor cost and used to calculate total factor productivity (9)	— —
(c) Charitable donations	*Used in derivation of GDP and personal income (10)	Absorption matrix and GDP (6)	Used in derivation of GDP i.e. must be added back if included in expense detail which has been deducted.	—
(d) Travel and entertainment	—	Absorption matrix and GDP (6)	Deducted as an intermediate expense in calculating GDP (9)	—
(e) All other expenses (excluding income taxes).	—	Absorption matrix and GDP (6)	Deducted as intermediate expenses in calculating GDP (9)	—
V. Labour costs				
(i) Wages and salaries —including commissions paid to own employees, bonuses, overtime, vacation pay and other taxable benefits such as free board and lodging, etc.	*Component of GDP at factor cost—GNI (9)	Used in "absorption matrix" i.e., input table and GDP (6)	Component of GDP at factor cost and used to calculate unit labour costs (9)	*Used in the construction of benchmark data for the derivation of labour income by industry
(ii) Employees benefits —(supplementary labour income).	*Component of GDP at factor cost—GNI (9)	Used in "absorption matrix" i.e., input table and GDP (6)	Component of GDP at factor cost (9)	—
VI. Net profit before income taxes	*Component of GDP at factor cost—GNI (9)	Component of GDP at factor cost (9)	Component of GDP at factor cost (9)	—
VII. Other items				
(i) Business personnel (a) Total number of paid employees last complete week of September. (b) Number of working proprietors or partners of unincorporated business. (c) Total number of hours worked in a typical week by (b) above. (d) Total number of hours worked in a typical week by family or other workers not receiving pay.	—	Used to derive employment by industry	Used to calculate productivity of labour (11)	—
(ii) Sales by class of customer —includes % breakdown between household consumers or individuals for personal use; industrial, commercial, institutional, governmental, farm (for use in farm production) and other large users; retailers or other businesses for resale.	Used in sectoring (12)	Used in sectoring (12)	—	—
(iii) Sales by class of commodity —includes dollar value of sales for in excess of 250 commodities in retail and wholesale trade.	Provides breakdown of personal expenditure on consumer goods and services as between durable goods and non-durable goods or by commodity (13)	Provides breakdown of personal expenditure on consumer goods and services as between durable goods and non-durable goods or by commodity (13)	Required to establish deflators for estimating GDP at constant prices	Provides weighting patterns for the construction of appropriate price indices (14)
(iv) Classification by kind of business —or 4-digit S.I.C. aggregative to 3-digit S.I.C.	—	To provide industrial distribution of data by industry of origin (15)	To provide industrial distribution by industry of origin (15)	—
(v) Form of organization —including breakouts as between individual proprietorship; partnership; incorporated company; co-operative; government; other, specify.	Allocation of data for sectoring (12)	Allocation of data for sectoring (12)	—	—

*The information provided by the census will be utilized to verify certain "benchmark" figures used by other data collection divisions which supply information on a monthly, quarterly or annual basis to the system of National Accounts.

dustry of the materials and services and primary factors of production such as depreciation, salaries and wages, employee benefits, etc. used by each industry.

The "make" and "absorption" matrices, together with information on net final demands, provide the basic data for input-output tables.

- (7) **Value added**—the value added of industries at true factor values is equal to the true factor value of their gross output less the true factor value of their intermediate inputs (consumption). It is a further refinement of the "census value added" concept in that the intermediate inputs or the costs of goods purchased from other industries are known in addition to a proper measurement of producers' value (output) and purchasers' value (input). (See GDP at factor cost (9) for equivalent).
- (8) **Gross domestic product at market prices**—is defined as gross domestic product at factor cost (9) plus an adjustment for the residual error of estimate and indirect taxes less subsidies.
- (9) **Gross domestic product at factor cost**—this can be calculated in three ways from the data collected by the 1971 Census of Merchandising and Service Businesses, as follows:
 - (a) the measurement of gross domestic product at factor cost can be obtained via the "census value added" approach, since such costs as advertising, insurance, repairs, communications, etc., purchased from other businesses can be deducted from the census value added of each industry (the latter already excludes major indirect taxes such as sales and excise taxes). The residual would then consist—after adjustment for other indirect taxes and subsidies—of factor incomes and capital consumption allowances (primary inputs) and would represent GDP originating in each industry.
 - (b) take the sum of the incomes accruing from production, and depreciation; these include salaries and wages, employee benefits (supplementary labour income), net profit or income (before taxes) and depreciation (GNI).
 - (c) gross domestic product is measured at constant prices (called real domestic product) as well as current prices. Real domestic product is obtained by deducting intermediate inputs at constant prices from gross outputs at constant prices. These data on real domestic product are also used to calculate labour productivity measures.
- (10) **Personal income**—is broadly defined as the measurement of all income received by Canadian residents such as: factor incomes of persons; transfer payments received by persons such as family allowances and unemployment insurance benefits; and charitable donations

which are treated as a current transfer from business to persons.

- (11) **Productivity of labour**—a measurement of the productivity of labour may be calculated by adjusting gross domestic product at factor cost (9) through the use of the double-deflation technique to provide deflated real output. The result divided by the total man-hours employed equals a measure of the productivity of labour.

A measure of output per unit of labour input is obtained by matching real domestic product (item 9 (c)) and corresponding labour inputs expressed in terms of man-hours or persons employed.

- (12) **Sectoring**—the allocation of data by form of organization provides information on the institutional arrangement of the Canadian economy in relation to the sectors.

A full set of National Accounts must distinguish among various sectors of the economy and must account for assorted types of transactions undertaken by and/or between classes of transactors. Four broadly distinguishable classes of transactors can be identified whose economic motivations and behavior are relatively homogeneous within each class, but essentially quite different from one class to the next. These are: persons, governments, businesses, and non-residents i.e., the rest of the world.

- (13) **Commodities in the measurement of personal expenditure on consumer goods and services**—personal expenditures on goods and services by type are obtained by aggregating the sales of various kinds of commodities, including both goods and services. Commodity sales estimates are based on commodity data derived from the Census of Merchandising and Service Businesses. These commodities or commodity groupings are further classified into durable, semi-durable and non-durable goods and the service component.
- (14) **Weighting patterns through commodities**—Prices Division develops weighting patterns for the construction of appropriate indices, using retail commodity sales as the input at the finest level of detail.
- (15) **Industrial distribution by industry of origin**—an industry is defined as a group of operating units engaged in the same or a similar kind of economic activity. By classifying each operating unit to a particular industry, it becomes possible to illustrate the contribution of each industry to the input or output being measured.

V. How Does the 1971 Census Satisfy Some of the Requirements of the Private Sector?

In addition to the detailed information to be obtained at the establishment or reporting unit level

(for the provinces and Canada), a separate questionnaire will request supplementary data on sales, cost of sales, salaries and wages, employment and inventories **for each business location and ancillary unit**. This implies the tabulation of these data by 3- and 4- digit S.I.C. classifications and kinds of business at the finest geographical level within the secrecy provisions of the Statistics Act.

The data provided in our location series tabulations can assist businessmen (and others) in the making of better decisions; help in the formulation of policies to determine store or business location; enable the user to calculate share-of-market ratios; and provide a barometer of the sophisticated demands of today's knowledgeable consumers through an analysis of retail sales by commodity grouping.

The kinds of information which will become available as a result of the 1971 Census will be of interest to a wide variety of users—particularly (but not limited to) those already operating within the retail, wholesale, service and manufacturing industries. For example, the data will be widely used by market research houses and advertising agencies, as well as by educational institutions, academics and students, to determine market penetration and growth rates, and in basic research on economic activities at the local, provincial and national levels.

In addition, trade and business associations will use the statistical information to analyze sales, inventory and other measurements in order to enlighten and broaden the knowledge of their members. Municipal planning boards and real estate developers will use these data as factors in urban redevelopment and shopping centre planning. Franchisors will obtain detailed information on the penetration and viability of franchised businesses in the highly competitive retail and service sectors.

Some mention should also be made of the uses of merchandising and services statistics in the communications field. Newspapers, periodicals and magazines, such as the *Financial Post*, *Canadian Business*, *Industrial Canada* and *Business Week* (to say nothing about a wide range of business-oriented trade magazines and newspapers), include data published by Statistics Canada in their various reports on business in Canada and the United States. Information on the retail, wholesale and service trades, developed in the course of the 1971 Census, will form a major component of such business reports.

VI. Concepts and Definitions

In order to expedite the planning of the census, a committee—known as the Committee on Planning for the 1971 Census of Merchandising and Services (or COPCOMS for short)—was formed in the Spring

of 1969.¹ The committee included, in addition to interested officers of the sponsoring Division, representatives of all the user divisions in the Bureau (now Statistics Canada). Its work program was divided into five modules or tasks, the second of which was a complete review of the concepts and definitions to be employed in the 1971 Census. The following is a summary of the conclusions reached in Module 2.

For the purpose of this article, concepts and definitions can be construed as referring to these subject-matter areas:

- The scope of the census
- The reporting unit
- Non-store type reporting units
- Head offices and other ancillary units
- Treatment of concessions
- The location series and definitions
- Other conceptual considerations

The Scope of the Census

The System of National Accounts—and the Standard Industrial Classifications—recognize several industrial divisions which taken together represent the total activity of the economy. The 1971 Census of Merchandising and Service Businesses will ensure adequate coverage of the retail, wholesale and service industries, i.e., Division 8 (wholesale and retail trade) and Major Groups 3 to 8 inclusive of Division 10 (community, business and personal services) of the S.I.C.²

In addition to coverage of reporting units in the usual "profit-motivated" areas in the retail, wholesale and service trades, the census will attempt to collect data on the business activities of governments and of non-profit organizations such as the Salvation Army and the Canadian National Institute for the Blind. Limited access stores, such as military post exchanges, duty-free stores, private membership department stores, etc., will also come within the scope of the census.

The classification of businesses to industrial divisions and 4-digit kind of business categories forms an essential part of the census. The correct classification of respondents provides the sound underpinning on which the census is based.

As in the past, the classification of business firms to different industrial divisions (for example, manufacturing, construction, wholesale trade, etc.) will be based on the concept of "**census value added**"—for which gross margin has been used as an approximation in the merchandising and service divisions. Within the same industrial division, busi-

¹ The background to this committee, as well as its terms of reference, are described in considerable detail in a paper entitled, "Report on Census Concepts," issued by the Merchandising and Services Division in April, 1971.

² *Standard Industrial Classification Manual*, revised 1970, pages 35-38 and 40-42 respectively.

nesses will be assigned to specific classifications, as well as kinds of business at the 4-digit level, on the basis of **major activity**. (This usually refers to the most important item—or group of items—in a business firm's commodity mix.)

Assignment of classification codes will be undertaken in three stages: first, on a very broad basis, prior to mail-out of questionnaires; second, through self-coding on the part of the respondent; and third, when the questionnaire is returned for editing and tabulation. One further check on classification is made at the mechanical edit stage, when commodity detail supplied by the respondent will be used to verify the coding. Proper classification will make possible the publication of data for 285 or more detailed kinds of business in the retail, wholesale and service trade areas of the economy.

The Reporting Unit

The basic reporting unit for the collection of data, in both 1961 and 1966, was the **establishment**—which was defined as "the smallest unit that is a separate operating entity capable of reporting those elements of input and output necessary to the calculation of gross margin, together with data on employment, wages and salaries". (It should be noted that this definition conforms with what is laid down in the S.I.C. However, the wording there usually refers to the reporting of "census value added".)

For a number of reasons, the planning committee felt that this definition would be inadequate for the purpose of the 1971 Census. Not only have there been many significant changes of an institutional nature in the merchandising and service areas during the past few years; even more important, the data requirements of users were found to be considerably more extensive and more complex than in any previous census.

Following extensive discussions with a group of multi-location and (in some cases) multi-activity companies during November of 1970, the committee finally reached a decision to introduce a **new reporting unit**—one which would enable the Merchandising and Services Division to collect data at a more detailed level than at any time in the past. This new entity, to be known as the "**merchandising reporting unit**" (MRU), was defined as "the smallest unit that is a separate operating entity capable of reporting all elements of basic industrial statistics necessary to the calculation of **net operating profit**."³ The MRU recognizes the realities of modern corporate accounting systems and therefore puts the respondent in a better position to respond accurately and with less burden.

³ In addition to MRU statistics, the census will also collect and publish a wide range of data on **business locations**—necessary to the calculation of consumer expenditure statistics for small geographic areas and widely used by market analysts.

The MRU series, like the 1961 and 1966 establishment series in the merchandising and service industries, will be based upon **record-keeping**, i.e., the ability to report. Consequently, it is felt that the MRU universe will be essentially the same as the establishment universes covered in the two previous censuses. It is understood, however, that there will be some differences as, for example, when a number of establishments have to be consolidated into one report in order to obtain detailed operating expense information by their **natural** elements of expense. The practice of creating "artificial" reporting units will be discontinued (with one or two exceptions) in the 1971 Census.

Non-store Type Reporting Units

A significant volume of retail sales is accounted for by businesses that deal **directly** with the household consumer, by-passing the retail store location, i.e., book and record clubs, mail-order agencies, door-to-door salesmen, etc. These non-store type reporting units⁴ fall within the scope of the census and will be surveyed in one of three ways, depending on the nature of their business activities.

- (1) Businesses which operate from a head office and/or supply depot, i.e., vending machine operators, home provisioners, mobile caterers, etc., will be asked to supply the minimum types of information required (see footnote 4) at the **provincial** level. Since most of these firms operate within a fairly narrow geographic area, it is not anticipated that there will be any problem in obtaining the necessary data.
- (2) Businesses which operate from a mail-order office, including those which rely solely on direct-mail and advertising programs to make and maintain contact with household consumers, do pose a difficult problem. Since, in such cases, there are no canvassers and sales may take place over a very broad area, there will be some difficulty in determining the provincial distribution of their sales. In the census, each such business will be treated as a **single** reporting unit located in the province in which its head office is situated and it will be asked to report data on gross margin, employment and salaries at the Canada level, together with an estimate of the destination of its sales by provinces.
- (3) Businesses which are comprised of one or more **self-employed canvassers** (i.e., newspaper delivery boys, cosmetics salesladies, vacuum cleaner salesmen, etc.) pose what is essentially a problem of **number** and of **record-keeping**. There are approximately 60,000 to 70,000 self-em-

⁴ The following criteria will apply to such firms: (i) the reporting unit must operate **principally** in the merchandising and services industries; and (ii) it must be a separate operating entity capable of reporting data necessary to the calculation of gross margin, salaries and wages, and employment.

played canvassers in Canada, most of whom maintain records which at best can be described as "sketchy", and all of whom meet the definition of a merchandising reporting unit. This problem was solved by the creation of artificial reporting units—each being an aggregation of "associated" canvassers (that is, associated with the same wholesaler or manufacturer) within each province. The data to be collected from these wholesalers and suppliers will consist of the following: total sales at estimated final selling prices; the number of canvassers; and an estimate of gross margins.

It should be noted that all data on non-store type reporting units will be published separately in the 1971 Census reports, in order to minimize discontinuity between this and previous censuses. These supplementary tables will permit a closer approximation of personal consumer expenditure at the provincial level.

Head Offices and Other Ancillary Units

In Canada, most businesses consist of only one location and one reporting unit, and these present no particular problem in the collection of data. Even those businesses which consist of a head office, possibly a warehouse, and a number of store locations can be processed without undue difficulty—provided that a full range of data on such head offices and other ancillary units, where they exist, are included in the MRU returns. (This is essential if these returns are to cover the economic operations of the universe and relate total inputs to total outputs.)

The problem of collection and allocation of head office and ancillary unit expenses is somewhat more complex in the case of "multi-MRU" companies in the merchandising and services industries. This situation occurs when there are two or more reporting units, capable of providing data to the net operating profit level, which have a common head office and related ancillary unit operations. In all such cases, data on head offices and ancillary units will be collected separately and allocated to individual MRU's on the basis of information obtained in the course of the Division's profiling activities.

The same approach will be utilized in the case of businesses which operate in more than one 3-digit S.I.C. classification and are capable of reporting the full range of statistics required for each such operation. That is, revenue and expense data will be reported separately for the head office and ancillary units, and allocated on a pre-determined basis over each reporting unit.

Treatment of Concessions

A "concession" or leased department is a separately-owned business which is operated as a department within the premises of another business—usually under license or contractual agreement.⁵

⁵ The characteristics of a concession are fully described in "Report on Census Concepts," Section 49.

The separate legal ownership of a leased department can usually be established by its ability to report data on sales, purchases, employment and operating expenses and by the fact that the operator takes the profit. Most concessions operate within the confines of Canada's department store locations, but they are also found in general merchandise stores, variety stores, hotels and resorts, etc.

Because of their importance for personal consumer expenditure purposes, it is necessary that a full range of information be collected for all concessions. It is also necessary that in businesses where concession sales are significant—such as department stores—some means be found of publishing the data so that it will reflect the existence of such business activities.⁶

In order to meet these requirements, the following approach was decided on:

- (1) At the MRU level, concession businesses will be **excluded** from the locations in which they are housed and will be aggregated together into a single reporting unit, classified to the kind of business designated by the major activity engaged in by each such concession business.
- (2) At the location level, the business activities of concessions in **department stores** will be published as part of the latter classification, but concessions located in other surroundings (see examples above) will be classified to their own kind of business on the basis of their particular major activity.

The Location Series

In the preceding sections, the reader's attention was focussed on the merchandising reporting unit. This was altogether appropriate, since the MRU series will meet the principal needs of internal and government users and be capable of aggregation with other Statistics Canada series. However, it should not be thought of as the only series, or even necessarily as the most important. The data needs of many users, including those in the private sector, are more fully met by statistical information on **business locations** in the merchandising and service trades.

To understand the significance of location statistics, it is necessary to bear in mind that the MRU is nothing more than an **accounting entity** for purposes of data collection. Only in businesses where there is only one physical location do the two series coincide. A small number of merchandising reporting units will include business activities not directly related to the operation of store locations (for example, manufacturing, direct selling, etc.). On the other hand, some **non-merchandising**

⁶ For purposes of market research or urban planning, a department store together with its leased departments is considered to be a totality; that is, it competes in the market place as *one* structure, rather than as a number of smaller stores.

reporting units—such as governments, construction companies, religious institutions, etc.—operate merchandising locations. Since the “market” for a particular kind of business or for a particular group of commodities consists **solely** of the activity taking place in physical locations, provision must be made for the publication of relevant statistics. This need will be met by the Census **location** series.

In both the 1961 and 1966 Censuses of Merchandising and Services, data were stratified into two series—one at the establishment (in 1971, the MRU) level, the other at the location level. This differentiation in statistical series will be maintained in 1971. Obviously, there will be a similar differentiation in concepts and definitions; surveying business locations is not quite the same thing as surveying merchandising reporting units. Because of the need for a different survey approach, one of the most pressing problems to which COPCOMS was required to address itself was to find a satisfactory answer to the question: “What is a location?”

In the earlier censuses, a location was defined as “a recognizable place of business”—with the emphasis on “recognizable”. In other words, if the field enumerator thought that he recognized a location, that was sufficient to satisfy the definition. Although this rough-and-ready rule of thumb sufficed on most occasions, it should be obvious that such an approach can (and did) lead to many inconsistencies in application and processing. In order to develop a more precise definition for the 1971 Census, a close examination of each area of merchandising was carried out by the committee. Four new definitions were developed as a result of this study: one a “general purpose” definition applicable to all locations, and the remaining three relevant to specific locations in the retail, wholesale and service trades. (For further information on the latter definitions, the reader is referred to “Report on Census Concepts”, Sections 42-47 inclusive.)

The Location Definition

For 1971, the location will be defined, in very general terms, as “**the place in which the business activity is conducted**”. The principal exception to this rule: retail and service concessions located within department stores (see also “Treatment of Concessions”). A location is generally considered to be an **indivisible entity** and its most important characteristic is its **physical** nature. Therefore, a location can exist and can be identified—even if it does not maintain separate detailed accounting records.

If more than one type of industrial activity (for example, retailing, manufacturing, etc.) is carried on at the same location, with only a single accounting record from which to derive information, the location will be classified to the industrial activity making the greatest contribution to gross margin (the nearest equivalent to “census value added”). If, on the other hand, more than one kind of business

within a **single** industrial activity is carried on at the same location, the kind of business classification will be determined by “major activity”—in other words, by the type of commodity which accounts for the largest proportion of sales.

There may be some confusion as to the differences between a location and a merchandising reporting unit. Perhaps the following brief analysis will assist the reader in differentiating between the two:

Where a single accounting record measures the detailed business activity at a single location, the merchandising reporting unit and the location coincide.

Where a single accounting record measures the detailed business activity at more than one location, all within the same kind of business and industry group, the reporting entity is described as multi-location MRU.

A reporting entity in which one or more locations individually or jointly engage in **different** kinds of business and/or industrial activities is described as a multi-activity MRU. In all cases, reporting requirements will be based upon record-keeping ability.

There is not necessarily a hierarchical relationship between merchandising reporting units and locations; in other words, location statistics cannot always be aggregated to MRU statistics. (In all fairness, however, it should be noted that location data are **not intended** to be additive with other Statistics Canada series, since they serve primarily “outside” users whose interests are focussed on small geographic areas below the provincial level.) The principal differences between the two series are as follows:

- (1) The MRU series, since it is based on record-keeping, will include not only locations and ancillary units within a specific universe, but may also include locations and ancillary units from related universes, as well as a modicum of activities in construction, finance, government and other economic sectors; and other industrial divisions.
- (2) The location series, since it is based on the physical nature of the business surroundings, will not include business activities which take place outside of locations nor will it include related activities falling outside of its specific universe, i.e., the retail trade location series will not include data on wholesale trade locations operated by a single MRU.

In summary, then, location statistics will not usually include the activities of non-store type businesses; nor will they provide a complete description of the entire range of activities which may take place within a single business location. Despite these limitations, however, it is expected that the 1971 location series will provide **the closest**,

and best, approximation of activity statistics available from any source.

Other Conceptual Considerations

In any undertaking of this magnitude there arise many forces, each pulling in a different direction, and all have to be reconciled. Decisions are made which may conflict in some way either with ongoing work in current surveys or with the varying needs of National Accounts or other data users. The very real problems of the respondent who is asked to provide a wide—and growing—range of information must also be a fundamental concern of those responsible for making the crucial decisions. The obvious (and only) solution to these problems must be to strike some kind of a balance between the user on one hand and the supplier of data on the other.

Because the 1971 Census must satisfy, as much as possible, the requirements of a System of National Accounts, reporting units must be surveyed at the level at which they can provide expenditure data based on **natural accounting elements**, rather than on a functional or departmentalized basis. This approach must be adopted on an “across the board” basis—despite the fact that the latter kinds of information are sometimes more easily available and also despite the fact that a consolidation of data may result, under some circumstances, in restricting the amount of information which can be made available for use in the current survey program.

The end result of this work, in particular the identification and solution of conceptual problems, will be to produce meaningful data for the use of National Accounts and the other integrated areas of Statistics Canada, as well as for the many users in industry, business, research and academe. In addition to being meaningful, these data must also possess another important characteristic—**timeliness**. It is in this connection that automation of the census is expected to make the greatest contribution.

VII. Impact of Automation on the Census

In order to satisfy the primary objectives of a higher and consistent level of quality and increased timeliness for the 1971 Census, an integrated automation package has been developed within which the computer system plays the major role and influences the contribution of the supporting sub-systems, and provides many of the controls for the census operation.

(1) The Computer System

- (a) **Creation of mailing file**—The primary source for names and addresses of business locations on the master mailing file was field enumeration; this however was supplemented by independent lists of universe areas requiring special control and checking, or which

were known to be difficult to enumerate. Computerized “decoding”⁷ and “matching” procedures were used to systematically pinpoint duplication between input sources, and within the combined master mailing file. Thus human resources were freed from the task of searching for duplicates and were required, primarily, only to research and validate those pinpointed mechanically.

- (b) **Editing and imputations**—Introduction of computerized editing will attain timeliness in the laborious task of checking coding, data ranges and totals, and achieve an otherwise impossible level of accuracy and consistency in data calculations and correlations between fields. Editing programmes are to be somewhat generalized, with the basic control for the procedures being edit control cards containing valid codes, data ranges and ratio values for interrelated fields. These editing procedures free human resources to research and solve only the problem data areas, and also provide editing flexibility; as documents are processed and it becomes apparent that certain ranges or ratio values must be altered, it may be done by changing control cards rather than modifying computer programmes. Although imputation procedures have not yet been finalized, the computer's greatest contribution in this area will be speed, the facility for controlling a more detailed selection criteria if necessary, and consistency in calculations.
- (c) **Tabulation requirements**—A wide range of tabulations, covering principle statistics as well as cross-classifications of the 400-odd detailed data items by geographic areas and detailed kinds of business for both MRU and location series, are planned—not only to satisfy an integrated system of national accounts but also census publications, internal divisional requirements, trades and industries surveyed, researchers and post-census requests. Preparation of photocopy tables for census publication, requiring primarily the addition of page numbers and footnotes prior to photo-reducing, alleviates the task of type-setting and subsequent proofreading—and frees human resources to concentrate solely on checking to prevent data disclosure and preparing any required links to past census data. Specifications are not yet finalized, but it is anticipated that a generalized retrieval system can be set up to handle currently unknown post-census data needs. The system would be designed to handle most requests within a pre-determined limit of the number of cross-classifications and levels of totals, with somewhat abbreviated column and stub headings—all to be supplied by control

⁷ Decoding of name and address fields was used to achieve a consistent format of both regardless of the varied original formats.

cards. Although somewhat less sophisticated than tailor-made programmes for each specific table, the system produces clearly labelled output with a minimum of effort and fast turnaround for each request received.

(2) The Supporting Sub-systems

The census mail-out packages (including questionnaires, instruction booklets, envelopes and publicity material) utilize co-ordinated colour schemes, streamlined copy and systematically emphasized answer boxes in order to elicit response, accuracy and timeliness in the data collection process, both from the point of view of the respondent and the keying operation of the returned documents. An addressing technique, using heat-activated individual labels rather than name and address impressions, coupled with automatic stuffing of most questionnaire packages, achieves clarity of address label and speed of mail-out preparation. A direct keying method using magnetic tape for most of the census data capture has removed the bulky handling and storage problems, as well as time-consuming computer card input operations, which would have been involved had the equivalent 3 million punch cards been used.

(3) Controls for the Census Operation

The basic controls are built into the computer system through the use of counts, user-specified control cards and listings. These controls enable management to know, at any given stage, precisely the status of the survey as regards number of companies in the universe, volume of data keyed, content of specified areas of the universe, number of outstanding respondents, etc., as well as providing an invaluable planning tool for future censuses, based on exactly what occurred during the 1971 Census. During record creation and editing, error counts provide the data necessary to alter quality control methods of manual operations or keying as the census progresses. Record counts, by type of unit in the universe or number of documents keyed and processed, provide the checking link between what should be and what is actually in "the system".

At the system specification and programming stage there are always a number of unknown factors—in certain instances generalized programmes with pre-determined options have been written which in production may be run by selecting the option required via user-specified control cards. For example, the mail-out, check-in and follow-up procedures may be run for the master mailing file in its entirety or staggered by major areas of the file, with the ultimate decision not being required until mail-out actually occurs.

In most instances, error listings have been formatted in such a way as to provide space on the listing for clerical coding of corrections, which are then keyed directly from the computer print-out. This saves clerical coding time, re-

duces copying errors, provides more legible data for keying, and substantially reduces keying error rates. Formatted listings of optionally selected areas of mailing or data tapes, user-specified as required, and produced in a number of sequences, facilitate checks that must be performed manually during the census. For mail-out of multi-location MRU packages which cannot be done by automatic stuffing, control listings by company of exact contents of each package are provided to assist and control the manual assembling operation. As completed documents are keyed and edited, control listings of both data totals and averages to date are produced, in order to check coding and keying operations as well as data trends.

The preceding paragraphs have pointed out some of the areas in which the automation package is expected to produce the timeliness, quality and flexibility required by the 1971 Census of Merchandising and Service Businesses, through the integration of the computer system with supporting sub-systems and controls.

VIII. Conclusion

A great deal of effort (much of it outlined in the preceding pages) has been expended on the planning—and the implementation of these plans—for the 1971 Census of Merchandising and Service Businesses. The users of merchandising and service trade statistics, both in Statistics Canada and outside,⁶ had a very strong voice in determining the content and directions of this survey, and in the deliberations which established the classifications and the publication program.

In addition, experts on schedule design were consulted in order to make the questionnaires and reporting instructions as easily understandable as possible. This, in turn, will lead to fewer errors and, hopefully, an improved response. Lastly, a high degree of automation will shorten the period between commencement of the census mail-out in February, 1972 and the publication of data in the latter part of 1973.

At this point in time, we are heavily dependent upon our ability to elicit a high degree of response from businesses within the merchandising and service trades universes. Everything that could be done to improve the questionnaire layout, to explain census requirements in simple language, to emphasize its importance to the information needs of the nation—in other words, **everything that could be done to enhance the census**—has now been done. The arrival of the first completed questionnaire will mark the end of planning for the 1971 Census of Merchandising and Service Businesses—and the **beginning** of the editing and other procedures necessary to produce the Census results.

⁶ Outside participants included federal and provincial government departments, trade associations, industrial organizations, and a number of large businesses in the merchandising and service industries.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 1, Section 4, Tables 1-8—Labour Force Survey

Seasonally adjusted data from 1953 have been revised in all tables containing labour force series. Revisions reflect improved seasonal factors derived from incorporation of the additional 12 months of data available for 1971.

Section 1, Table 6, Section 8, Table 7—New Dwelling Construction

Seasonally adjusted data in Section 1 have been revised from 1968 forward. Revisions reflect the incorporation of information available for 1971.

Starting with January 1972 the Central Mortgage and Housing Corporation published data of housing starts and completions in urban areas of 10,000 population and over as defined by the 1971 Census. In order to maintain comparability with previously published figures, Statistics Canada will continue during 1972 to publish data based on the 1966 area definitions. Users interested in both series may refer to New Residential Construction, monthly, Catalogue 64-002.

Section 1, Table 8, Section 13, Table 10—Commercial Failures and Liabilities

Seasonally adjusted data have been revised from 1968 forward. Revisions reflect the incorporation of additional information available for 1971.

Section 5, Table 4—Consumer Price Indexes

The shelter element of regional city housing indexes moves on the basis of changes in rents only, whereas in the Canada index this movement is derived from changes in both rents and home ownership costs.

National Income and Expenditure Accounts, 4th Quarter 1971

During 1971, GNP at current prices rose 9.1 per cent against 7.5 per cent in 1970. In real terms, the rates were 5.4 and 3.3 per cent, respectively.

Both merchandise and non-merchandise imports accelerated faster than exports, thus bringing the 1970 surplus to a much lower level in 1971.

In real terms, consumer expenditures, government purchases and business investment in housing were the components responsible for most of the GNE increase in 1971.

ANNUAL CHANGES IN GNE AND COMPONENTS

ALL DATA SEASONALLY ADJUSTED AT ANNUAL RATES.

GNE increased by 920 million constant 1961 dollars in the fourth quarter of 1971, with most of the gain being in consumer spending, non-form business inventory investment and business gross fixed capital.

QUARTERLY CHANGES IN GNE AND COMPONENTS

NATIONAL INCOME AND EXPENDITURE ACCOUNTS PRELIMINARY FOURTH QUARTER AND ANNUAL 1971

Gross National Product

The preliminary estimates of income and expenditure for the fourth quarter of 1971,¹ and revised estimates for earlier quarters of the year confirm previous evidence of a strong resurgence of economic activity. The recovery, which started in the fourth quarter of 1970, appears to have been maintained at a remarkably even tempo throughout 1971, with volume increases in national production of around 1½% in each quarter.

Gross National Product rose by 9.1% in current dollars in 1971, compared with 7.5% in 1970, reaching a level of \$92.1 billion. This advance was accompanied by further deceleration in the implicit price index which rose by 3.4% in 1971 compared with 4.1% in 1970 and 4.7% in 1969. After removing the effect of prices, real growth amounted to 5.4% in 1971²—the largest annual volume gain since 1966 and in sharp contrast to the increase of only 3.3% in 1970. The current strength of the economy would be more clearly revealed by an examination of rates of growth since the beginning of the recovery period. Since the fourth quarter of 1970 alone, GNP rose by 10½% with a corresponding volume increase of 6%.

Domestic demand was the major source of growth in 1971, in contrast to 1970 when the external sector provided most of the stimulus. Consumer spending, especially on durable goods, accelerated sharply year over year, as did expenditures on housing construction, while current expenditures by governments continued to be one of the fastest growing elements of demand. Business fixed investment in plant and equipment rose less rapidly in 1971, while investment in business non-farm inventories did not contribute to growth in the year. It should be noted, however, that some acceleration in inventory investment appeared to take place at the end of the year.

The income side of the Accounts gives a somewhat stronger picture of economic performance in 1971 than the expenditure side. Several categories of income displayed remarkable growth during 1971, in particular corporation profits rising by about 16% compared with a 6% decline in 1970; accrued net income of farm operators increasing by 26.4% against a decline of 19.2% in 1970; and net income of non-farm unincorporated business rising by 7.7% against 3.2% in the previous year. Labour income which constitutes by far the largest category of in-

come rose by some 10% in 1971 against about 9% in 1970.

Against the background of strong economic expansion in 1971, the rate of unemployment remained above 6% during 1971, a level which had been reached as early as the second quarter of 1970. Although the number of persons employed showed a relatively large increase in 1971, rising by 2.5% compared with 1.3% in 1970, the strong growth in the labour force of 3.1% was not fully absorbed.

Consumer Goods and Services

Consumer spending on goods and services increased by 8.5% in 1971 compared with 5.3% in 1970. This represented a return to the rates of growth ranging between 8% and 10% which had prevailed since the mid early sixties.

In 1971 a very large increase of 15.7% was recorded in purchases of durable goods. Expenditures on semi-durables also accelerated but to a lesser extent—7.3% over 1970. Purchases of non-durable goods rose by 7.7% in 1971 compared with 8.2% in 1970. A growth of 7.6% in spending on services represented a modest acceleration over 1970 but was a slower rate than that experienced in the years immediately preceding 1970.

Purchases of new motor vehicles rose by about 27% in 1971 and accounted for more than half the growth of spending on consumer durable goods. This high level of purchases in part reflected the effects of the strikes in the fourth quarter of 1970 and to some extent expectations of price increases. Among other categories of durable goods which also showed strong acceleration in line with the high level of new residential construction, purchases of home appliances rose 17% and furniture 11%. Recreation equipment also rose sharply, by 14%.

Within semi-durable goods, purchases of women's clothing recorded the largest increase at 9.1% in 1971 against 1.8% in 1970. This increase represents almost half the increase in semi-durable goods. Spending on such goods as home furnishings, textiles and dinnerware, also contributed largely to the overall increase.

Among non-durable goods, expenditures on food, alcoholic beverages, tobacco, and utilities rose somewhat more slowly than in 1970, while purchases of household supplies and miscellaneous goods accelerated.

Spending on personal services at a rate of increase of 7.6% in 1971 is modest compared with recent years, due in part to the extension of Medicare to all provinces, which had the effect of transferring most of the spending on health services from the consumer to the government sector.

¹ Revised estimates for 1970 are not yet complete. Revisions to recently published estimates will be effected at the time of the next report.

² The publication for the third quarter of 1971 suggested the possibility of a somewhat higher growth rate for the year. Newly available information has led to revisions in a number of components.

Government Current Expenditure on Goods and Services

Current expenditures of governments on goods and services grew in 1971 at 12.1%, a rapid but slightly slower rate of growth than in the previous year when they rose by 15.5%. These expenditures contributed strongly to the rate of growth of GNE in 1971. Provincial governments expenditure rose by 18% while municipal spending increased by 14%. The rate of increase of expenditure by the Federal Government rose to 5.9%, slightly higher than the 5.1% recorded in 1970. At the federal and municipal levels of government, increases in wages and salaries account for most of the gains, while at the provincial level expenditures under Medicare contributed more to the increase than did the growth of wages and salaries.

Gross Fixed Capital Formation

Investment in capital goods contributed substantially to the growth of GNP in 1971, more so than it had in 1970. The rate of increase was 11.3% compared to 4.2% in 1970, owing to a large extent to the very substantial increase in spending on new housing, which rose by almost 23%, following a decline of 8% in the previous year. Dwelling starts, supported by easier financing conditions, reached a record high at almost 234,000 units. Government outlays on fixed capital formation also rose strongly in 1971, by 16.2%.

The increase in business investment in plant and equipment of \$687 million was largely concentrated in non-residential construction, which rose by \$514 million, or 9.8%. By contrast, spending on machinery and equipment rose by only 2.9% in 1971. By industry, a decline in business fixed investment was observed in the manufacturing industries. This decline was only partially offset by the increased outlays shown by utilities. These two sectors normally constitute the largest portion of the investment programme. The agricultural sector, the mining industries as well as governments showed a rather strong increase while other industries experienced relatively less change.

Investment in Inventories

There was little change in investment in inventories during 1971 as a whole. Accumulation of inventories totalled \$151 million compared to \$122 million in 1970 and a sizable \$1,043 million in 1969. Accumulation occurred in both the farm and the non-farm sectors. In 1970, more than half the accumulation of \$313 million in non-farm business inventories had been offset by decumulation in farm inventories. The swing of \$236 million in the latter to an accumulation of \$58 million in 1971 is mainly due to a substantial increase in grain production.

Investment in non-farm business inventories in 1971 remained relatively low at \$125 million compared to \$313 million in 1970, \$534 million in 1969 and \$473 million in 1968. In 1971, a strong accumulation of inventories at the retail level was accom-

panied by reductions at the wholesale level and in the manufacturing industries. In the preceding year most industries had shown modest increases. The stock-to-sales ratio in manufacturing industries was reduced noticeably in 1971. This was also the case in wholesale trade, while the stock-to-sales ratio in retail trade has remained essentially unchanged.

Exports and Imports of Goods and Services

The external sector was influenced by a number of important factors. The recovery in economic activity in Canada during 1971, the highly unsettled state surrounding the United States balance of payments problems and measures taken in August to alleviate them, and the lagged effects of the decision to float the Canadian dollar in June 1970 all contributed to changes in this sector.

The positive balance on current transactions in goods and services declined dramatically in 1971 to \$53 million from close to \$1 billion in the previous year, as the surplus on merchandise trade diminished steadily through the year and net payments for services continued to grow.

The principal factor underlying the change in merchandise transactions was the growing strength in demand for imports as the Canadian economy strengthened—imports of goods overall rose by over 12% to \$15,552 million, with a 10% increase in United States sales to Canada and a remarkable 38% increase from Japan. Motor vehicles and parts imports overshadowed other commodity groups both in absolute dollar levels and in the rate of increase which were respectively \$4,449 million (Trade of Canada basis) and over 25%.

Demand from Canadian exports, although increasing in 1971 by 6%, was stepped down from the high rate of growth experienced in 1970. Total exports of goods of \$17,746 million reflected strong demands from the United States with a gain of 10%, but diminished sales to the United Kingdom, Japan and to the European Common Market. Recovery in demand conditions in these latter countries during the year generally lagged behind the North American economies. Particularly strong increases in motor vehicles and parts sales, wheat, lumber and petroleum and natural gas sales were registered, with motor vehicle and parts sales reaching \$4,305 million (Trade of Canada basis), almost 20% above 1970.

In the area of services, the growing deficit which reached \$2,141 million, was due largely to the higher level of investment income payments abroad, reflecting an unusually high outflow in the final quarter of 1971. Total payments and receipts were both higher than in the previous year, although only modestly so in the case of receipts. Some offsets occurred in service items as a slightly reduced deficit on international travel account was in part offset by lower net earnings on account of freight and shipping transactions.

(Continued on page 113)

LABOUR FORCE (More detail in Section 4, Table 3)

THE EMPLOYMENT/UNEMPLOYMENT SITUATION SHOWED LITTLE CHANGE BETWEEN DECEMBER AND JANUARY WITH THE UNEMPLOYMENT RATE FALLING FROM 6.3% IN DECEMBER TO 6.2% IN JANUARY. EMPLOYMENT INCREASED BY 0.3%.

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

RETAIL SALES IN DECEMBER DECREASED 1.1% BELOW THE NOVEMBER LEVELS. LARGEST DECREASES WERE REGISTERED IN GENERAL MERCHANDISE STORES (10.4%), SHOE STORES (8.6%) AND WOMEN'S CLOTHING STORES (6.4%). TRADE GROUPS REPORTING MOST NOTABLE INCREASES IN SALES WERE, JEWELLERY STORES (14.8%) AND ALL OTHER FOOD STORES (3.8%).

UNIT SALES OF NEW MOTOR VEHICLES DECLINED 8% OVER NOVEMBER 1971 BUT ARE UP 50% OVER DECEMBER 1970. COMMERCIAL VEHICLES SALES ARE DOWN 2% OVER LAST MONTH, BUT UP 83% OVER DECEMBER 1970. NEW PASSENGER CAR SALES ARE DOWN OVER 8% OVER NOVEMBER 1971, UP 43% OVER DECEMBER 1970. THOSE MANUFACTURED IN NORTH AMERICA ARE DOWN 13% FROM LAST MONTH, AND UP 53% OVER A YEAR AGO, AND THOSE MANUFACTURED OVERSEAS ARE UP 2% OVER NOVEMBER 1971 AND UP 21% OVER DECEMBER 1970.

INCOME & EXPENDITURE ACCOUNTS, BALANCE OF INTERNATIONAL PAYMENTS (More detail in Section 3, Tables 1, 2 and 4, 1)

PRELIMINARY ESTIMATES INDICATE A STRONG RESURGENCE OF ECONOMIC ACTIVITY IN 1971. GNP ROSE BY 9.1 PER CENT OVER THE 1970 LEVEL. IN CONSTANT DOLLARS, GROWTH AMOUNTED TO 5.4 PER CENT. THE RECOVERY WAS MAINTAINED AT AN EVEN TEMPO THROUGHOUT THE YEAR, WITH VOLUME INCREASES OF AROUND 1-½ PER CENT IN EACH QUARTER. DOMESTIC DEMAND, ESPECIALLY FOR CONSUMER GOODS AND FOR NEW HOUSING PROVIDED THE MAJOR STIMULUS. THE EXPANSION WAS REFLECTED ON THE INCOME SIDE BY AN ACCELERATED RISE IN LABOUR INCOME AND BY A SHARP REBOUND IN CORPORATION PROFITS.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts.

²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between recorded measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown from the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. Sources for above tables: Annual and Quarterly Estimates of the Canadian Balance of International Payments (67-201 and 67-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. ¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 3: manufacturing inventories¹ by industry based on the 1960 stondord industrial classifcication (million dollors)

end of period	total inventories owned	non- durables	durables	foods and bevereges	tobacco products	rubber	leother	textile	knitting mills	clothing	wood

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". ¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures are net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing of maker's own plant.

⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-0011), Statistics Canada.

¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, cake, lubricating oil and grease, still gas and other products.

Note: Campanments may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months.³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, wieners and all other sausage.⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalodes which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), Statistics Canada.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also *Credit Statistics* (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Instalment financing components do not include interest and other unearned income finance charges. Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Includes traffic interchanged between Canadian railways.

¹Includes Class 1 carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues.

³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services.

Sources: Motor Carriers-Freight (53-005) quarterly, Passenger Bus Statistics (53-002) monthly, and Urban Transit (53-003) monthly, Statistics Canada.

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

¹Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. ²Total new settled-for ordinary sales in Canada. Total sales figure does not include sales for Northwest Territories. ⁴Under new or amended contracts. ⁵Revisions for 1970 are preliminary.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, Statistics Canada.

*Data for April to December are shown only where there is continuity from fiscal year 1970-71.

*March 1970 figures are preliminary in that they do not include supplementary accounts.

Incomes

On the income side, the strong increase in corporation profits was characteristic of the early stage of economic recovery. Preliminary estimates show an increase of 15.9% in 1971, a marked improvement over the 6.2% decline in 1970. Most of the growth appears to have taken place in the first three quarters of 1971 when successive increases of more than 10% were posted. On a gross basis, that is, before deduction of depreciation, profits rose by 12% in 1971.

Labour income increased by 9.9% in 1971 as compared with increases of 8.9% in 1970 and 12.2% in 1969. While both the goods-producing and service-producing industries advanced at a faster rate than in 1970 the acceleration was greater in the goods-producing industries.

Wages and salaries in the goods-producing industries increased by 8.5%, as a result of increases in average earnings. Except for 1969, this constituted the largest gain since 1966. The most notable increases took place in manufacturing and construction which were affected by strikes to a larger degree in 1970 than in 1971. Manufacturing wages and salaries rose by 7.5% compared with 5.6% in 1970, while in construction the increase was 13.4% compared with 9.6% in the previous year.

Wages and salaries in the service-producing industries increased by 10.9% as compared with gains of 10.2 and 14.2% recorded in 1970 and 1969, respectively. Employment advanced at about the same rate as in 1970 while average earnings accelerated slightly. All industries registered advances, although a large part of the increase was due to higher wages and salaries in services, up 11.8% with larger gains recorded in the commercial sector than in the non-commercial sector.

All remaining components of income with the exception of interest and miscellaneous investment income recorded stronger rates of growth in 1971. Mainly owing to larger crops, accrued net income of farm operators from farm production was much improved over the previous year, increasing by 26.4% in 1971 after declining sharply by 19.2% in 1970. Net income of non-farm unincorporated business rose by 7.7% in 1971 against 3.2% in 1970, the largest rate of increase since 1963. Personal income grew by 10.2% in 1971, compared with a 7.7% increase in 1970. Rising wages and salaries and government transfer payments to persons, the latter up by nearly 15%, contributed mainly to this acceleration. Personal disposable income also grew very strongly, by 9.8%, the largest increase since 1966.

Price Movements

The implicit price index for Gross National Expenditure rose 3.4% in 1971, a significant easing from the 4.1% increase experienced in 1970. A slowdown in the price rise for personal expenditure

to 2.3%, the lowest since 1965, contributed largely to this movement. The implicit price index for exports also rose at much slower rate in 1971.

Though price moderation was evident in all major components of personal expenditure on goods and services, prices of durable goods showed the most notable deceleration, rising by 1.3% as against 2.9% in 1970. Within durable goods, most commodities showed lower price increases or actual price declines, with the exception of automobile prices which rose by 3.5%—the largest increase in many years. The slowdown in the implicit price index for non-durable goods was in part due to a much smaller increase in food prices, from 1.5% in 1970 to 0.8% in 1971, and to declines in prices of medical and pharmaceutical products.

The implicit price index for gross fixed capital formation rose at a faster rate than the overall GNE deflator. It showed an acceleration from 3% in 1970 to 4.7% in 1971. The faster rate of price increase was entirely due to price movements in construction, as machinery and equipment prices rose at about the same moderate rate of 2½% as in the previous two years. Sharply rising materials prices, especially of lumber and steel, were responsible for the higher rates of increase shown by the implicit price indexes for business residential and non-residential construction; the wage components rose at about the same rate as in 1970.

Price rises in the external sector were relatively small. A decline of 0.4% in the merchandise component of export prices held the rise of the overall export index to 0.8% for the year, a notably lower rate of increase than experienced in recent years. The drop in the price index for merchandise exports was mostly due to declines in metal prices at the beginning of the year. Much of the deceleration in the implicit price index for imports was attributable to the rising importance of the merchandise component, for which the deflator has a lower absolute level than that for services.

The Government Sector, 1971

Total revenues of all levels of government combined (excluding inter-governmental transfers) rose by about 11% in 1971. The major increases occurred in revenues from personal direct taxes and indirect taxes. Personal income tax revenues rose at both the federal and provincial levels. The gain in revenue from indirect taxes was spread over the three levels of government and was due mainly to higher returns from federal and provincial sales taxes and local government property taxes. Gains were also registered in other revenue sources, the most important being in revenues from direct corporate taxes and investment income.

Increased outlays on goods and services and transfers to persons were the important contributors to the higher level of total government expenditures, an increase of 12½% in the year. The rise in goods and services reflected mainly higher wage and

salary payments. By level of government, the gain was concentrated at the provincial, where Medicare payments were also a factor, and local governments. Transfer payments to persons rose by almost 15%. The largest part of the rise was in federal payments, particularly in old age security pensions and unemployment insurance benefits. At the provincial level, rises were notable in direct relief and payments to post-secondary educational institutions and benevolent associations.

With revenues rising somewhat less sharply than expenditures, the government sector surplus, on a national accounts basis and including the Canada and Quebec Pension Plans, declined from \$1,278 million in 1970 to \$939 million in 1971. The federal government deficit widened from \$12 million to \$350 million. The movements at the provincial and local government levels were partly offsetting with the provincial government deficit narrowing while the local governments moved from a small surplus to a deficit position. The surplus of the Canada and Quebec Pension Plans showed little change.

Fourth Quarter 1971

Preliminary estimates for the closing quarter of 1971 show a continuation of the expansion in economic activity evident throughout the year. Gross National Product at market prices seasonally adjusted at annual rates,³ rose by 2.4% or by \$2.2 billion, to a level of \$95.6 billion. After deducting that part of the increased value of goods and services due to rising prices, the real rate of growth of the economy amounted to 1.4%—about the same brisk pace as in the previous three quarters.

Demand

Most major components of demand appear to have risen at sizable rates in the fourth quarter, with particularly notable increases being shown by consumer outlays on new automobiles and other durable goods, investment in non-farm business inventories, and government current expenditure on goods and services. Expenditure on fixed capital formation was also very strong, reflecting a further gain in spending on new housing and a marked pick-up in business investment in machinery and equipment. As experienced in the previous four quarters of economic recovery, domestic demand rose faster than domestic production. An acceleration in import demand, which again rose by much more than exports, resulted in a sharp deterioration in the balance of transactions in goods and services with non-residents.

The rise in personal expenditure on consumer goods and services of 2.2% (or \$1,192 million) at annual rates represented an acceleration over the third quarter gain of 1.8%. (In terms of volume, the fourth quarter rise of 1.7% was particularly notable.) Expenditure on durable goods has been the most dynamic component of consumer demand during 1971, showing rises of 4.5% in the first quarter and of 8.0% in the second quarter. After slackening in the third quarter, when this category of expenditure rose by 1.1%, it rebounded sharply in the final quarter with a 5.8% increase, adding \$380 million to total expenditure. As in most recent previous quarters, spending on new cars—up 6%—made the largest contribution within durable goods. However, accelerated increases were also noted in most other components, particularly in recreation equipment and in goods associated with new housing, such as household furniture and equipment. Consumer outlays on semi-durable goods (goods such as shoes

³ Unless otherwise stated all quarter amounts in this report are expressed seasonally adjusted at annual rates.

and clothing and personal effects like jewellery and watches) also registered sizable gains, rising by almost 3%, compared with a marginal decline in the previous quarter.

Outlays on the other major categories of consumer expenditure, non-durable goods and services, slowed in the quarter. The percentage rise of 0.7% shown by non-durable goods was the smallest quarterly rate of increase of the year. Previous increases were 1.6% in the third quarter, 4.1% in the second quarter and 1.4% in the first quarter. Spending on alcoholic beverages and on tobacco, declined in the quarter by 6% and 4% respectively. Among items showing increases were food outlays, which rose by 2%, and fuel outlays which rose by 4%. The rate of increase of expenditure on services was somewhat lower than in the third quarter (2.4% versus 2.7%) but well above the rates of increase of about 1½% shown in the first two quarters of the year. The most note-worthy increases occurred in expenditures on shelter, up by almost 3% as in the previous quarter, and on public transportation (such as railway, bus and airline travel), up by nearly 8%.

Government current expenditure on goods and services rose at a sharply accelerated pace, 5.0%, as compared with 2.6% in the third quarter. Of the rise of \$888 million, which was the largest recorded in many years, \$520 million was accounted for by expenditure at the federal level of government. In the federal portion, defence expenditure rose by \$196 million (due entirely to increases in military pay and allowances) and non-defence expenditure rose by \$324 million, a little over half of which was in wages and salaries. Government expenditure on fixed capital formation rose by 1.9%, a lesser rate of increase than in previous quarters.

There was continued strength in business fixed capital formation, housing outlays rising by a further 3.1%, on top of large gains in the second and third quarters of 8.0% and 6.4% respectively, and investment in plant and equipment rising by 2.5% compared with 1.5% in the third quarter. In contrast with the third quarter, when spending on non-residential construction and on machinery and equipment rose at the same rate of 1.5%, practically all the increase in fourth quarter spending was concentrated in machinery and equipment, which rose by 4.8%. Much of this increase was due to business spending on commercial vehicles.

A feature of the quarter was the sizable increase of \$404 million in investment in non-farm business inventories, from an accumulation of \$204 million in the third quarter to a further accumulation of \$608 million in the fourth quarter. Whereas in the third quarter the accumulation was concentrated in retail trade, in the fourth quarter inventory build-up was fairly general. The accumulation of \$212 million in manufacturing inventories was the first sizable build-up in over a year. Within manufacturing, increases were concentrated in the durable-goods

groups and especially in transportation equipment. Wholesale trade showed moderate accumulations of \$132 million following depletions in the second and third quarters; in retail trade a build-up of over \$600 million in the third quarter was followed in the fourth by a smaller accumulation of \$360 million. Two thirds of the fourth quarter accumulation occurred in non-durable lines, with clothing and food showing the largest increases. Though manufacturers and other businesses increased their inventory holdings, sales generally rose at a faster rate so that the stock-to-sales ratio in manufacturing and in wholesale trade fell further in the period, while in retail trade it remained approximately level.

The buoyancy in domestic demand in 1971 has been reflected in quarterly rises in imports much in excess of the growth in GNP. In the fourth quarter, imports rose by 5.1% or \$1,156 million, while exports rose by 1.5%, or \$340 million, resulting in a very sharp deterioration of \$816 million in the balance of transactions in goods and services from a small deficit of \$64 million in the third quarter (the first deficit since the fourth quarter of 1969) to a deficit of \$880 million. The deterioration in the overall balance was due to a fall of \$424 million in the merchandise surplus, as imports of goods rose by 3.8% whereas exports of goods rose by 1.0%, and to a \$392 million increase in the non-merchandise deficit, the latter largely due to irregularly large dividend payments. The bulk of the increase in merchandise exports in the quarter went to the United States, whereas increases in imports were mostly from overseas countries. Consequently, the fall in the merchandise surplus in the fourth quarter was entirely due to transactions with overseas countries.

Incomes

Moving to the income side, labour income increased by \$1,072 million to a level of \$53,496 million. In percentage terms, the rate of increase was 2.0%—a slightly faster rate than in the third quarter. Wages and salaries rose more rapidly in the service-producing industries, where they were up 2.6% (about the same as the average quarterly gain recorded in 1971). Wages and salaries in the goods-producing industries, slowed from a 1.5% rise in the third quarter to a 1.2% rise in the fourth. Within the goods-producing industries, wages and salaries in construction rose by a strong 3%, after showing little change in the strike-affected previous quarter; in manufacturing, on the other hand, wages and salaries rose by only 0.8%. In the service-producing industries, the most notable increases occurred in trade, up 5.0%, and in public administration, up 4.7%, the increase in the latter being largely attributable to retroactive payments to federal employees.

Very preliminary estimates of corporation profits before taxes indicate a fourth consecutive rise but at a much smaller rate—up 1.7% to a level of \$9,384 million—than in each of the first three

quarters when gains of 10% and over were registered. A marked deceleration was also noted in gross profits (corporation profits plus allowances for depreciation of capital). Most other income components rose sharply in the quarter. In particular, accrued net income of farm operators from farm production increased by 9.2%, largely because of substantial subsidy payments under the Temporary Wheat Reserves Act. Net income of non-farm unincorporated business rose by 2.7%, with the most notable gains occurring in the construction and the retail trade industries.

Price Movements

The implicit price index for Gross National Expenditure rose by 1.0% in the fourth quarter, a continuation of the pattern established in the earlier quarters of the year. Increases in most indexes were moderate and generally smaller than in the third quarter. The price control measures adopted in the United States in August 1971 no doubt had an impact on the prices of many imported commodities, especially consumer durable goods and machinery and equipment. The only sizable upward movement was displayed by the implicit price index for government current expenditure on goods and services, which was up by 3.4%, largely due to increased rates of pay at the federal level (including some retroactivity), and to an irregular movement in employer superannuation contributions.

A deceleration occurred in the rate of increase of the price index for personal expenditure on consumer goods and services, from a rise of 0.8% in the third quarter to one of 0.5% in the fourth quarter. While the rise of 0.9% shown by the price index for services was of the same magnitude as in recent quarters, the implicit price index for durable goods declined while those for semi-durable goods and non-durable goods slowed. The 0.5% decline in the durable goods price index was attributable to continued small declines in the prices of television sets, radios and musical instruments and to a 1.1% fall in car prices. (Unadjusted for seasonality, the prices normally increase in the fourth quarter of the year; in the fourth quarter 1971, they remained virtually unchanged.)

The implicit price index for business gross fixed capital formation rose by only 0.4%, after a rise of 1.9% in the third quarter. The price deceleration was most marked in machinery and equipment—the implicit price index for this component showing practically no change after a 1.0% increase in the third quarter. Construction prices also slowed considerably in the quarter, mainly due to much smaller rises in materials prices than had been experienced in the recent past. The residential construction price index rose by 1.3% compared with 3.1% in the third quarter; the non-residential construction price index rose by 0.8% compared with 1.7%. The slowdown in the implicit price index for business gross fixed capital formation as a whole was also due in

¹ Implicit price indexes are currently weighted (Paasche) and therefore reflect changes in expenditure patterns as well as price changes of individual items.

large part to the rising weight of business spending on machinery and equipment, for which the absolute level of the index is lower than for construction.

The implicit price index for exports remained flat in the quarter, following a 1.1% rise in the third quarter. Though price increases were noted in lumber, zinc and non-farm machinery and equipment, these were offset by declines in other prices, particularly in prices of wheat, woodpulp, aluminum and copper. The implicit index for imports,⁴ which was influenced by the recent price control measures in the United States, fell in the quarter, by 0.8% compared with a 1.8% increase in the third quarter.

⁴ It may be noted that since imports are a negative entry in Gross National Expenditure a price decline in this component appears to raise the implicit price index. However, import prices will already have been reflected in the various other categories of gross national expenditure. The implicit price index is accordingly a price measure for domestically produced goods and services.

The Government Sector — Fourth Quarter

Total expenditures of all levels of government combined (excluding transfers between levels of government), seasonally adjusted at annual rates, rose by about 5½% in the fourth quarter of 1971, the largest increase in recent quarters. Total revenues increased at a slower rate, by about 2.4%, with the result that the surplus of the government sector, on a national accounts basis, fell by \$1,048 million to a rate of \$224 million.

Much of the gain in government expenditures took place at the federal level. The largest increases occurred in outlays on goods and services, transfer payments to persons, due to a sharp rise in unemployment insurance payments, and subsidies, reflecting a large payment made under the Temporary Wheat Reserves Act.

Personal direct taxes and indirect taxes were the most important sources for the increase in total government revenues. Both the federal and provincial levels shared in the gains.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for Selected Economic Indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 5—Retail Trade, New Motor Vehicle Sales (Units)

Revisions to the unadjusted sales data for 1969, 1970 and 1971 have necessitated revisions to the seasonally adjusted data also. These revisions are shown here for the first time. Revisions to seasonally adjusted retail trade data back to 1966 will be published in the February 1971 issue of *Retail Trade* (Catalogue, 63-005), and for new motor vehicles in the annual edition of *New Motor Vehicle Sales, 1971* (Catalogue, 63-208).

Section 3, Tables 4.2, and 4.3—Canadian Balance of International Payments

These tables contain revised data for the years 1969, 1970, and 1971.

Section 5, Table 1—Industry Selling Price Indexes**Table 2—General Wholesale Price Indexes****Table 3—Other Price Indexes**

1971 data for the above tables have been revised to reflect incorporation of more complete information.

Section 6, Table 8—Rubber

The series Stocks of Synthetic rubber has been dropped from this table because the data are confidential.

Section 13, Table 4—Cheques Cashed in Clearing Centres

Revisions to seasonally adjusted series in this table and in Section 1, Table 8 reflect the incorporation of data for 1971. Revisions extend back to January 1969.

Section 13, Table 5—Life Insurance Sales

This table contains revised data for the year 1970.

Series published in the Canadian Statistical Review form part of larger data blocks which are available in machine readable form for use on computers, or in printouts, from the Statistics Canada computerized time series bank (CANSIM). For all series in the data bank, current and revised data are entered immediately on release. Approximately the 10th of each month a special Canadian Statistical Review public tape is created which contains historical and current data for all series in the Review, plus some supplementary series.

Inquiries concerning either this Review or CANSIM may be directed to the General Time Series Staff, Statistics Canada.

YOUTH PARTICIPATION IN THE LABOUR FORCE: IMPACT OF SCHOOL ENROLMENT ON PARTICIPATION RATES OF MALES 20-24 YEARS OF AGE, BETWEEN THE YEARS 1966 AND 1971

Nicole Gendreau*

This note supplements an article by the same author, "Youth Participation in the Labour Force: 1953-70", which appeared in a new publication released in March, *Notes on Labour Statistics 1971*, Catalogue 72-207, annual. Having observed that young persons had experienced much higher rates of unemployment than the labour force as a whole while exhibiting decreasing participation rates, the author explored the possibility that the youth sector had suffered from even higher unemployment on account of the "discouraged worker" effect, that is, a tendency to leave the labour force when demand for labour was falling.

Data available at the time only permitted the analysis of participation rates of the various youth groups at the global level without differentiating the behaviour in the labour force of the two components, students and non-students.

In this note, the author using new information, further analyzes the impact of school enrolment on participation rates of men in the 20-24 age group and examines the changes in the participation of the two sub-groups, students and non-students, between 1966 and 1971.

Labour force participation rates — the percentages of given populations which are in the labour force at a given point in time — are among the more important data series used in labour market analysis. While the most dramatic trend in recent years has been the increasing participation of women, possibly more interest at the present time centres on a slight decrease which is occurring in the participation rates for the age group 14-24. This examination is limited to one segment of the youth sector, namely, males 20-24.

Over the past two decades, participation rates of young males have tended to move downwards as a result of longer years of schooling and later entry into the labour force. The younger age group (14-19) was affected first, but by the 1960's the 20-24 age group was also feeling the effects of higher enrolment rates. Between 1953 and 1971 the annual average participation rate for the latter group declined from 92.9 to 83.4%, a change of almost 10 percentage points. Chart 1 shows the annual pattern in four representative years: 1953, 1960, 1966 and 1971.

As would be expected, the downward trend in participation over this period has been more pronounced in school months than in the summer. In the peak month of July,¹ the rate fell 4.7 percentage points from 96.7 to 92.0 and in the trough month of March,² 12.7 points from 91.3 to 78.6.

* Nicole Gendreau, Labour Analyst, Manpower Research and Development Staff of the Labour Division.

¹ Because of the influx of students into the labour force, July has constantly been the peak month for participation rates of males 20-24.

² The lowest annual participation rate of males 20-24 seems to have shifted from winter months in earlier years to spring months in more recent years. March was chosen as the trough point because it has the lowest average participation rate.

Although it was evident that the larger number of young men continuing their education tended to reduce the labour force participation for this group, it had not been determined whether the reduction was solely attributable to higher school enrolment, or whether other factors played some part. To neutralize the enrolment effect required knowledge of the respective participation rates of students and non-students over time. A special study carried out in conjunction with the April 1971 monthly Labour Force Survey provided information on enrolled and out-of-school populations. A methodology was developed using the information obtained and estimates were prepared to approximate the in-school and out-of-school populations.³ This methodology is applicable only to the school months, but for these months the estimates could be extended back to 1966.

Analysis of Results

Participation rates estimated for students and non-students are shown in Chart 2 and Table 1, together with actual rates from the monthly Labour Force Survey for total males 20-24. To demonstrate the behaviour of participation rates in a summary way, the highest and lowest months of employment during the school year, October and February⁴ were selected. For comparison purposes, participation rates for males 25-44 are also included in Table 1. Selected Canada unemployment rates are shown in Table 2.

³ Using the April survey, the relationships between full-time student status and responses to questions of the regular schedule were established. These relationships were used to identify the full-time students at other points in time. Only those who qualified as full-time students by the chosen criteria were labelled as "in school"; the others were considered as "out-of-school".

⁴ The school year was defined as October to April to avoid late entry and the early end of term associated with this age group.

CHART - 1

As may be seen in Chart 2, student participation in the labour force was much higher at the beginning of the school year than in February; for non-students, participation was also higher in the fall, but differences between the peak and trough months were less marked. This could indicate a tendency on the part of the students to hold on to their summer jobs after the term had begun.

Table 1 shows that student and non-student participation have been at the two extremes of the scale: students range from 11.2 in February to 23.2 in October, and non-students from 96.7 to 98.8. It will be noted that participation rates for non-students 20-24 have moved in much the same way as those for males 25-44. Also, they have consistently been slightly higher in level despite substantially higher rates of unemployment experienced by males under 25 (see Table 2). These observations suggest that younger males, when not

attending school, have an attachment to the labour force at least as strong as males 25-44.

Probably the most interesting finding is that for non-students the participation rates declined by 1.4 and 1.2 percentage points respectively in October and February, whereas the corresponding rates for students increased by 5.1 and 2.2 points during the period under review. The higher participation of students could be attributable to a larger proportion of students needing to be in the labour force in order to finance their education, since post-secondary education is now more widespread than in the past.

For the 20-24 age group as a whole, participation in the labour force is heavily influenced by the not-in-school component which, despite higher enrolment, still accounted for 77% of the total in

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2.3)

THE SEASONALLY ADJUSTED INDEX OF INDUSTRIAL PRODUCTION INCREASED BY 0.3% IN JANUARY TO A LEVEL OF 184.0 FROM THE REVISED LEVEL OF 183.3 IN DECEMBER. ALL THE INCREASE CAME FROM MANUFACTURING, WHERE BOTH DURABLE AND NON-DURABLE GOODS OUTPUT SHARED IN THE GROWTH. THE OUTPUT OF BOTH MINING AND UTILITIES DECLINED.

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

RETAIL SALES IN JANUARY WERE 0.5% BELOW DECEMBER 1971 LEVELS. SHOE STORES RECORDED THE LARGEST DECREASE (6.8%), FOLLOWED CLOSELY BY JEWELLERY STORES (6.6%). OF THE TRADE GROUPS REPORTING INCREASES IN SALES, THE MOST NOTABLE WERE, GENERAL MERCHANDISE STORES (16.9%), AND HARDWARE STORES (13.8%).

IN JANUARY 1972 NEW MOTOR VEHICLE SALES WERE 4.8% BELOW DECEMBER 1971, ALTHOUGH 34.9% ABOVE A YEAR AGO, WHEN AN INDUSTRY STRIKE AFFECTED SALES OF VEHICLES MANUFACTURED IN CANADA AND THE U.S. OVERSEAS MANUFACTURED PASSENGER CARS MAINTAINED THEIR SALES IN JANUARY 1972 OVER THE PREVIOUS MONTH, AND WERE 24.9% ABOVE THOSE OF A YEAR AGO.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. ⁵The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁶See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

2 - Domestic product by industry

Table 2.3: industrial production, volume indexes (1961 = 100), based on the 1960 standard industrial classification - continued

years and months		durable manufacturing															
		primary metal industries					metal fabricating (ex mach. & transportation equipment)										
		total	iron & steel mills	steel pipe & tube mills	iron found- ries	smelting and refining	total	bailer & plate works	fabri- cated struc- tural metal	arnamen- tal & architec- tural metal	metal stamping, pressing & coating	wire & wire products	hard- ware, tool & cutlery	ma- chinery (except elec- trical)	transp. equipment		
															total	aircraft and parts	motor vehicles¹
		1961 industry weights

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts. ²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between recorded measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown from the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. Sources for above tables: Annual and Quarterly Estimates of the Canadian Balance of International Payments (67-201 and 67-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. ³The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ⁴Includes miscellaneous manufacturing industries. ⁵Includes also publishing and allied industries. ⁶Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review. ³The shelter element of regional city housing indexes moves on the basis of changes in rents only, whereas in the Canada index this movement is derived from changes in both rents and home ownership costs. ⁴Indexes for Quebec City and Thunder Bay are on the (1969=100) base.

Table 1: total inventories, shipments and orders in manufacturing based on the 1960 standard industrial classification (million dollars)

years and months	inventory at end of month									
	shipments ¹	new orders received during month ²	unfilled orders at end of month	owned ³	held but not owned	all inventory held				ratio of inventories owned to shipments
						total	raw materials	goods in process	finished products

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Total inventories owned by manufacturers including warehouse stocks.
Statistics Canada.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001).

Table 4: estimated value of shipments and unfilled orders in manufacturing industries, by economic use classification, based on the 1960 standard industrial classification (million dollars)

years and months	shipments							unfilled orders at end of month						
	consumer goods		machinery and equipment	construction materials and components	other intermediate goods and supplies	export-based industries	supplementary classification: automotive products	consumer goods		machinery and equipment	construction materials and components	other intermediate goods and supplies	export-based industries	supplementary classification: automotive products

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". ¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports.

⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing at maker's own plant.

⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), Statistics Canada.

¹Production plus imports less re-exports, minus exports.²Data for 1969, 1970 and 1971, have been revised and are shown here for the first time. Full details will be shown in *New Motor Vehicle Sales, 1971* (Cat. no. 63-208). ³Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), Statistics Canada.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted.
²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage.
⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Reports, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), Statistics Canada.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Instalment financing components do not include interest and other unearned income finance charges.

Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, Statistics Canada.

¹Includes Class 1 carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues.

³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services. Sources: Motor Carriers-Freight (53-005) quarterly, Passenger Bus Statistics (53-002) monthly, and Urban Transit (53-003) monthly, Statistics Canada.

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

¹Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. ²Total new settled-for ordinary sales in Canada. Total sales figure does not include sales for Northwest Territories. ³Under new or amended contracts. ⁴Source: Monthly Survey of Life Insurance Sales in Canada, Life Insurance Agency Management Association, Hartford, Connecticut, U. S. A.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Sources: Commercial Failures (61-002) Quarterly, Statistics Canada.

Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments.

²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22).

³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical and Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitation services.

Sources: Canada Gazette and Dept. of Finance.

*Data for April 1971 to January 1972 are shown only where there is continuity from fiscal year 1970-71.

*March 1970 figures are preliminary in that they do not include supplementary accounts.

¹ The Labour Force, Catalogue 71-001, monthly.

² Unemployment rates of the "out-of-school" group as defined in footnote 3.

1971.⁵ The effect of enrolment is felt, nevertheless: as the proportion of students grows, the global participation rate is dampened by the lower propensity of students to participate in the labour force. Given, therefore, a declining overall participation rate, the problem is to measure the respective contributions of higher enrolments and of changes in the participation rates of students and non-students.

Estimation results⁶ reported in Table 3 show the relative contributions of changes in enrolment

⁵ The "in school population" as a per cent of males 20-24 years of age rose from 16 to 23% between 1966 and 1971. For a definition of the "in school population" see footnote 3.

⁶ The results were generated by means of the following equality which is an application of the formula used in differential calculus to obtain the derivative of a product of functions.

$$PR = PR_s \cdot \frac{Pop_s}{Pop} + PR_{n-s} \cdot \frac{Pop_{n-s}}{Pop}$$

$$= PR_s \cdot ER + PR_{n-s} \cdot (1-ER)$$

$$= ER (PR_s - PR_{n-s}) + PR_{n-s}$$

$$\text{Therefore, } \Delta PR = \Delta ER (PR_s - PR_{n-s}) + \Delta PR_s (ER) + \Delta PR_{n-s} (1-ER) + \Delta ER (\Delta PR_s - \Delta PR_{n-s}).$$

Where PR = the participation rate;

Pop = the population;

ER = the enrolment rate; and,

s and n-s stand for students and non-students respectively.

$\Delta ER (PR_s - PR_{n-s})$ represents the impact of enrolment on the participation (shown on line 1 of Table 3); $\Delta PR_s (ER)$ gives the participation resulting from increase in participation of students (see line 2, Table 3); $\Delta PR_{n-s} (1-ER)$ yields losses in participation due to decreases in participation of non-students (line 3 of Table 3); and, $\Delta ER (\Delta PR_s - \Delta PR_{n-s})$, participation changes associated with the interaction of enrolment and participation of students and non-students (last line of Table 3).

rates and in participation rates of students and non-students (from Table 1), to the changes observed in the overall participation rate between 1966 and 1971. It will be seen that higher school enrolment was responsible for more than 90% of the decline in the overall participation rate in both months under observation. At the same time, increased student participation raised the overall participation rate (a negative contribution of 20.2% and 5.6% respectively in October and February). This increase in student participation was more than offset, however, by the effect of a slight decline in participation of the major group—non-students—which accounted for a decrease of 30.5% and 16.8% respectively in the two months.

The net effect of changes in the participation rates of students and non-students combined was similar in the two months (10.3% of the overall variation in October and 11.2% in February), in spite of the fact that the absolute values were much larger in October than in February. These larger values of the impact were associated with the larger changes taking place in the participation rates of both sub-groups in the month of October.

Conclusion

Examination of the estimates confirmed that the trend to lower participation among young adult males is primarily due to growth occurring in school attendance. It has been re-inforced, however, by a slight decrease in the participation rate of those who left school (following closely the pattern established for men 25-44 years of age). During the six-year period, student participation has increased notably, but the effect on the overall participation rate is limited because the students are still a relatively small component in the 20-24 age group.

TABLE 3. Contribution of Enrolment and of Participation Rates of Students and Non-Students to Changes in Participation Rates of Males 20-24 Years of Age, Selected Months, 1966-71

Source of variation in participation rate of males 20-24 years of age	Oct. 1966 to Oct. 1971		Feb. 1966 to Feb. 1971	
	Actual change	Percentage contribution	Actual change	Percentage contribution
	percentage			
Total variation (from Table 1)	- 3.86	100.0	- 5.78	100.0
1. Change in enrolment rates	- 3.74	96.9	- 5.32	92.1
2. Change in participation rates of students	0.78	- 20.2	0.32	- 5.6
3. Change in participation rates of non-students	- 1.18	30.5	- 0.97	16.8
Net effect (2) + (3)	(10.3)		(11.2)
4. Interaction of enrolment rates and participation rates of students and non-students	0.28	- 7.3	0.20	- 3.4

Note: The sums of individual items may not always equal totals because of rounding.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for Selected Economic Indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * *

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

- .. figures not available
- ... figures not appropriate or not applicable
- amount too small to be expressed
- nil or zero.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.
- MCD months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 6—Value of Building Permits

Data for this table are revised for the years 1969, 1970 and 1971. Data for January to March 1972 will appear in the June issue.

Section 2, Table 1—Population

Data for the year 1971 are revised to include the incorporation of information from the 1971 Census.

Section 3, Table 3.1—Financial Flows Matrix

Data for the fourth quarter 1971 are published in the present issue of the Review. Supplementary tables covering revised fourth quarter 1970 and for the years 1970 and 1971 appear on pages 114 to 119 of this issue.

Section 6, Table 15—Primary Iron and Steel

The annual 1969 data on *Net Shipments of Steel Shapes to Consuming Industries* include information for 4 months for which monthly data could not be provided because of strikes in the industry.

Section 11, Tables 1 to 4—Trade of Canada

Data in this section incorporate all revisions made by the data source as of April 1972. The seasonally adjusted series are subject to further revision.

Income Distributions by Size in Canada 1969. Catalogue 13-544 Occasional.

Federal Government Expenditures on the Human Sciences. Fiscal 1969-70, Catalogue 13-545 Occasional. This publication begins a comprehensive statistical series on activities in the field of social sciences and humanities.

Series published in the Canadian Statistical Review form part of larger data blocks which are available in machine readable form for use on computers, or in printouts, from the Statistics Canada computerized time series bank (CANSIM). For all series in the data bank, current and revised data are entered immediately on release. Approximately the 10th of each month a special Canadian Statistical Review public tape is created which contains historical and current data for all series in the Review, plus some supplementary series.

Inquiries concerning either this Review or CANSIM may be directed to the General Time Series Staff, Statistics Canada.

THE NATIONAL NUTRITION SURVEY (NUTRITION CANADA)

E.M. Carson and M.S. Nargundkar*

I. Introduction

The National Nutrition Survey, "Nutrition Canada", is the first survey of its type to be carried out on a national basis in Canada. The survey is being conducted by the Food and Drug Directorate of the Department of National Health and Welfare in cooperation with the health departments in the ten provinces. The purpose of the survey is to study the dietary patterns and to evaluate the nutritional value of food ingested by persons living in Canada. Smaller studies in subject matter areas encompassed by the survey have been conducted in selected segments of the Canadian population, for example, studies of dental health of school children, and a nutrition study of Canadian Eskimos. During the course of such studies, and through related research, experts began to uncover evidence indicating the appearance of nutritional disorders in the Canadian population.

Improvements in food marketing facilities brought about by modern technology have resulted in changes in the patterns and varieties of foods commonly ingested by Canadians. Also, many of the food products available on the market today contain additives such as preservatives, artificial flavours and artificial colours. These substances may have harmful effects on health if they are consumed in large quantities over an extended period of time.

Although government health authorities are aware of nutritional disorders and the possible consequences on health resulting from changing patterns of food consumption, very little data was available to indicate the extent of the problems or reflect the amount of change that has occurred. Hence, the Nutrition Canada Survey was developed (i) to evaluate the dietary habits of Canadians, (ii) to determine the types of foods ingested by Canadians and the nutritional value of the foods, and (iii) to study the types of nutritional disorders occurring and the extent to which they may prevail. These findings will be correlated with geographical location, income level, age and sex to provide information for the planning of health and nutrition programs in Canada.

It may be noted that since the Nutrition Survey was begun, Nutrition Canada has become a series of surveys. The first and largest of these is the household survey, of which the sample design and some aspects of the survey methodology are described here. In addition, surveys of Indians, Eskimos, and the non-native northern population are being conducted. A survey of youth travelling in Canada is planned for the summer months.

II. Planning

The Food and Drug Directorate of the Department of National Health and Welfare studies the composition of foods sold in Canada and writes regulations which are used in controlling the use of food additives. Hence it was at the Directorate that the initial steps towards conducting a survey of this nature were taken.

The first step was to initiate a study to determine the feasibility of conducting a nutrition survey on a national scale. The provincial governments were contacted to determine the extent of their interest and possible participation in terms of data requirements and the use of provincial health clinic facilities. This study resulted in the establishment of guidelines for the survey, including a recommendation to form expert groups in five areas pertinent to the survey. The five areas were:

- (i) survey methodology,
- (ii) dietary information,
- (iii) clinical examination and anthropometric measurements,
- (iv) biochemical parameters, and
- (v) dental examination.

The members of these groups were chosen from federal and provincial government departments and universities.

Statistics Canada was approached to assist in the development of the survey methodology. The Special Surveys Development Staff of Statistics Canada participated in preparing the survey methodology guidelines and developed the sample design. The Field Division of Statistics Canada have been carrying out the field work required to select the sample for the Nutrition Canada Survey.

A pilot survey was conducted in June 1970 in four areas, two urban and two rural, at Guelph, Ontario. The pilot survey was designed to test all aspects of the field methodology; sample selection, training programs, publicity, clinic interviews and examinations. The pilot study was the first attempt to amalgamate all parts of the survey methodology and as a test study proved extremely valuable. On the basis of experience gained during this pilot survey, the methodology was modified and the plans for the survey were revised. The survey field work began in the province of Ontario in September 1970.

III. Sample Design

The following guidelines were established for the development of the sample design:

- (i) The survey should cover the non-institutional, non-native population of the ten provinces.
- (ii) Estimates of characteristics should be available for five regions, namely, Atlantic, Quebec, Ontario, Prairies and Pacific.
- (iii) Stratification variables should be:
 - (a) Type of area, namely metropolitan, non-metropolitan urban centres, and other non-metropolitan areas. Patterns of food ingested, types of foods available, and nutritional values of the available foods were expected to vary with the type of area.

* Miss Carson is a statistician and Mr. Nargundkar is Chief of the Special Projects Section, of Special Surveys Development Staff, Methodology and Systems Branch, Statistics Canada.

- (b) Income level, namely low income and other income. It was expected that the type of food ingested by the members of Canadian families would be related to their income level.
- (c) Age and sex. Ten age-sex groups are considered.

Sex	Years of age
Males and females	0- 4
Males and females	5- 9
Males	10- 19
Females	10- 19
Males	20- 39
Females	20- 39
Males	40- 64
Females	40- 64
Males	65 +
Females	65 +

Age and sex are used as post-stratification variables to classify persons before the final stage of selection. Age and sex factors are important because particular nutritional disorders tend to occur more frequently among persons of particular age-sex groups. In addition, nutritional needs of persons vary for different ages and sexes. Hence, for the first national survey of nutrition it was desirable to include in the sample persons distributed across all ages and both sexes.

- (d) Family types. Four family types were defined to be used as post-stratification variables for one half of the sample. Family types were considered for inclusion in the survey because it was felt that the dietary habits and other nutritional characteristics vary with family type. For example, the nutritional characteristics of a person living alone would likely differ from the nutritional characteristics of a member of a family with children. The pilot survey revealed extreme operational difficulties in applying this variable, and it was discarded before the Nutrition Canada Survey began.
- (iv) Cost, time, and the scale of operations called for the survey to be conducted over a two-year period during which time the seasonal variation in characteristics could be observed. To estimate this variation, it was proposed that the survey be conducted twice in each region, at two different times of the year. A year is divided roughly into two seasons, summer and winter. Each season corresponds to the portion of the year during which the effects of seasonal food habits could be expected to persist.

Using these guidelines and the operational constraints, the following sample design was developed for the Nutrition Canada household survey. The Nutrition Canada sample is a stratified, three stage probability sample. The first stage sampling units are 1966 Census Enumeration Areas (EAs), second stage units are households within selected EAs and the third stage units are persons within selected households.

IV. Survey Frame

The frame of the survey was defined as the civilian, non-institutional population of the ten provinces of Canada. This includes all persons in the ten provinces except persons living (i) in prisons, hospitals, etc., (ii) in hotels and motels, (iii) on Indian reservations and crownland, (iv) on military bases, camps, etc., and (v) in foreign diplomatic premises.

Operationally it is not feasible to carry out the survey in remote areas of the ten provinces. The remote areas are those which are not easily accessible by road and/or do not have facilities to set up a survey clinic or to accommodate the twenty-member clinic team. It is difficult to identify all such areas in Canada in advance in order to exclude them from the frame. Hence, these areas are included in the frame. When such an area is selected, however, it is replaced by a similar area which is accessible for the operation.

This does introduce a bias in the survey data. However, as the population living in such remote area is relatively small, the bias is small and can be tolerated when compared with the cost, time and other resources required either to identify all remote areas and remove them from the frame or to make special provisions for conducting the survey in those areas.

V. Stratification

The most recent data available for stratification were the 1961 and 1966 Census data. These data were limited in various ways. The 1961 Census income data, collected on a sample basis, were almost 10 years out of date. Even the 1966 data used to stratify by population density could not give information about demolished or expanded areas. Further, using data from two Censuses meant that the boundaries of enumeration areas and census tracts, for which the data were tabulated, were not always the same.

With these constraints in mind, 1966 Census tracts, municipalities or townships were used as units of stratification. The 1966 Census population counts were used for stratification by types of area within regions. The income information from the 1961 Census data was used to stratify the types of area further by income levels. In other words, the ten provinces were grouped into five regions:

Atlantic Region (Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick)
Quebec
Ontario
Prairies (Manitoba, Saskatchewan, Alberta)
Pacific (British Columbia)

Each region was then divided into three area types (i) metropolitan areas, (ii) non-metropolitan areas with population over 5,000 persons, and (iii) the remaining non-metropolitan areas.

Within each population density stratum, areas were stratified into two income strata on the basis of income levels/family size defined below:

- (1) Areas with average income less than the defined level for the average family size were classified as low income areas.

Average family size	Defined income level per annum for stratification
1	\$1,500
2	2,500
3	3,000
4	3,500
With increments of \$500 for each additional person.	

- (2) Areas that did not fall in category (1) were classified as other income areas. Having stratified census tracts or municipalities into one of the six basic strata, the enumeration areas which made up the larger areas were classified as belonging to that stratum.

VI. Sample Size and Sample Allocation

The choice of the sample size emerged from consideration of several factors. As very little was known about the nutritional characteristics of the population, determination of the sample size could not be made rigorously on the basis of statistical criteria.

The first stage sampling units were to be EAs, and thus the determination of an overall sample size was influenced by the number of persons that could be included in the sample from each EA. It was estimated, on the basis of length of interviews and clinic team composition, that the efficient operation of a clinic would require a total of 50 persons daily, at the clinic centre. Thus, the number of persons selected from an EA had to be a multiple of 50 as the clinic cannot be moved from one place to another within a working day. The average size of an EA is 500 persons (about 150 households). Considering the age-sex distribution of the enumeration areas and the age-sex distribution required for the sample from each EA, (namely an equal number of persons from each age-sex group), it was determined that the sample size for each EA would be 50 persons.

The choice of EAs as first stage sampling units was based on the following considerations:

- (i) an area used as a first stage sampling unit should be compact to minimize the travelling cost of enumerators, and allow for the transportation of persons to the survey clinic,
- (ii) the number and the distribution by age and sex of persons living in an area used as a first stage sampling unit should be known, and
- (iii) the area should not be so large as to produce a cluster effect at the first stage of selection. At

the same time it must be large enough to provide the required 50 persons, 5 from each of the 10 age-sex groups, for a survey clinic.

Consideration was then given to the number of EAs to be selected. When the survey was conceived, it was proposed that one half of the EAs selected for the survey would be controlled to obtain a sample of persons from 10 age-sex groups and the other half to obtain a sample of families of four types. To estimate the seasonal variation, two matched samples, one summer and the other winter should be selected. To give proportionate representation to three types of areas, the number of EAs to be allocated should be approximately proportional to the size of the three types of areas within a region. Another consideration was to allocate an equal number of EAs to each of the five regions. Finally, of course, another factor influencing the choice of the sample size was the cost of the survey.

The sample size was determined in the following way: Number of EAs allocated to a type of area stratum = (types of income sub-strata within a type of area) × (types of control, namely age-sex and family types) × (number of seasonal samples) = $2 \times 2 \times 2 = 8$. Now the approximate proportion of population in three types of area in each region is 5:3:2. Hence, 80 EAs [$(5 \times 8) + (3 \times 8) + (2 \times 8)$], were allocated to each region or 400 EAs for Canada. Of the 80 areas to be surveyed in each region, 40 were allocated to the metropolitan areas of the region, 24 to non-metropolitan urban areas with population greater than 5,000 persons and 16 to the remaining non-metropolitan areas.

This gives the sample size of $400 \times 50 = 20,000$ persons or 4,000 from each region.

To have the desired allocation of EAs to all provinces within the Atlantic and Prairie regions and to all metropolitan areas in Canada some minor modifications were made. The final allocation of EAs to the 10 provinces for one season is given in Table 1.

VII. Sample Selection Procedure and Field Operation

For the survey, Canada is divided into 5 regions, each region is stratified into 6 basic strata as described above, and the required number of EAs are selected from each stratum.

Selection of enumeration areas, the first stage sampling units, was carried out by Statistics Canada before the field operation began. From each stratum an independent sample of EA's was selected with probability proportional to the 1966 population of the EA. One half the selected areas were assigned randomly to the summer sample; the remainder to the winter sample.

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2.3)

The seasonally adjusted index of industrial production remained unchanged in february from the downward revised level of 183.9 in January. The mining industry and utilities registered increases. The decrease in manufacturing output originated with the non-durable goods industries.

		(1961=100)

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

Retail sales in February recorded an increase of 1.1% in the seasonally adjusted data above the January 1972 levels. Fuel dealers recorded the largest increase from the previous month (25.0%) with the remaining trades ranging between +4.9% (for service stations and garages) and -3.7% (for furniture, T. V. radio and appliance stores).

Neither North American nor overseas manufactured passenger cars showed an appreciable change in seasonally adjusted sales from January to February 1972. Overseas cars, however, show a much sharper percent increase over February 1971 than North American cars. Commercial vehicles recorded a 9% increase over January 1972 and a 55% increase over February 1971.

SELECTED ECONOMIC INDICATORS—SEASONALLY ADJUSTED

EXPORTS AND IMPORTS (More detail in Section 11, Tables 1 and 2)

Exports for the first quarter 1972 totalled \$4544 million, up \$12 million from the fourth quarter 1971. Shipments to the U.S. rose \$240 million, but exports to the U.K. and rest of the world fell by \$83 million and \$145 million. Imports at \$4434 million were \$263 million higher. U.S., U.K., and rest of the World contributions were \$31, \$13 and \$219 millions.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts. ²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. Source: The Labour Force (71-001), Statistics Canada.

¹See footnote 1, table 3. Labour force obtained as the sum of employed and unemployed from tables 5 and 7. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force (71-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. Source: Employment and Average Weekly Wages and Salaries (72-002), Statistics Canada.

¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review. ³The shelter element of regional city housing indexes moves on the basis of changes in rents only, whereas in the Canada index this movement is derived from changes in both rents and home ownership costs. ⁴Indexes for Quebec City and Thunder Bay are on the (1969=100) base.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". ¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing at maker's own plant.

⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), Statistics Canada.

¹Production plus imports less re-exports, minus exports. ²Data for 1969, 1970 and 1971, have been revised and are shown here for the first time. Full details will be shown in *New Motor Vehicle Sales, 1971* (Cat. no. 63-208). ³Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D.B.S.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentones plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentones plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories of end of period being held at gas plants and in storage covers. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). Source: Building Permits (64-001), Statistics Canada.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. ²Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. ³Includes rye, flaxseed, rapeseed, soybeans and corn. ⁴Includes clover and grass seed, hay, clover, greenhouse products, mustard seed, sunflower seed, hogs, dry beans and dry peas and miscellaneous products. ⁵Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Stocks of fresh and cured meats previously reported in this publication are no longer collected and therefore not available. ²Excludes stocks in (railway) transit after June 30, 1968. Source: Stocks of Dairy and Poultry Products (32-009); Stocks of Meat Products (32-012), Statistics Canada, Livestock and Meat Trade Report, Dept. of Agriculture.

Table 5: selected agricultural price indexes

[illegible]

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Reports, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), Statistics Canada.

Table 1: value of retail trade by type of business and province, based on the 1960 standard industrial classification - concluded

¹Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortgages home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans and bills owing to doctors, dentists, lawyers, and other personal service credit as they are not available. ²Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. Starting with January 1970 this series affected by transfer of passenger cars financed for commercial purposes from consumer goods to commercial goods; from January 1971 amounts shown exclude unearned finance charges; for December 1970 this change had the effect of reducing the gross figure by 13.5 per cent. ⁴Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁵Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁶The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁷Till December 1970 data for only Oil Companies. From first quarter 1971 figures include statistics for transportation and travel and entertainment card-issuing companies. For seasonal adjustment purposes seasonal factors for oil company credit cards were used to adjust the new series other credit card issuers on the assumption that the two series are subject to the same seasonal effects. ⁸Bills due for residential/domestic use of telephones, gas and electric power. Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, and Dept. of Insurance.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Form machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, exco-voting and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, Statistics Canada.

¹Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues. ³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services. Sources: Motor Carriers-Freight (53-005) quarterly, Passenger Bus Statistics (53-002) monthly, and Urban Transit (53-003) monthly, Statistics Canada.

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, Statistics Canada.

Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments. ²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical and Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitation services.

Sources: Canada Gazette and Dept. of Finance.

*Data for April 1971 to February 1972 are shown only where there is continuity from fiscal year 1970-71.

*March 1970 figures are preliminary in that they do not include supplementary accounts.

Within a selected area, the sampling ratio for households was calculated to allow for the selection of the required number of people from the age-sex group which occurred least often in the area in 1966, in order to satisfy the restriction that equal numbers of persons from all age-sex groups be surveyed in each area. With experience it became possible to place minimum and maximum limits on the number of households expected to be selected in an area. It was found that with an expected sample size of more than 45 households, the sample of persons was likely to adequately satisfy the sample restrictions. With an expected sample size of more than 90 households the cost of this portion of the field operation became unacceptable, especially in light of the fact that some age-sex groups would still not meet the sample requirements. Hence, the sampling ratios for households are determined basically from the 1966 age-sex distribution but are modified to produce an expected sample size for households in the range 45-90.

The first stage of the field operation, listing of households and sample selection of persons, is carried out by the Statistics Canada Regional Offices. For a selected enumeration area, an interviewer is provided with a map of the area, a control booklet in which she records the addresses of all households located within the boundaries of the area and household cards on which she records the name, age and sex of all persons residing in selected households.

The interviewer is required to record in the control booklet the addresses of all households within the boundaries of the selected area. Each address is recorded beside a listing number. Listing numbers for selected households have been determined in advance by the sampling intervals and are marked accordingly.

When the interviewer reaches a selected household, she enters and records on a household membership card the age, sex and identification information for each person in that household. It is from the persons listed in this way that the survey sample of persons is selected.

At the regional office the persons living in the selected households are stratified into the ten defined age-sex groups. From each group a random sample of the required size is drawn. A list of the selected people, together with their addresses, telephone numbers, and other information useful to the survey Advance Party Interviewers is prepared.

The Advance Party Interviewers are trained interviewers who carry out the second stage of field operations, working about one to one and one-half weeks ahead of the survey clinic team.

Essentially their duties are twofold:

- (i) to explain the survey to the selected persons, enlist their co-operation, and arrange appointments for their interviews and examinations with the clinic team, and
- (ii) to conduct a short household interview to collect basic socio-economic data about the selected persons and basic information on food facilities, food buying, and food preparation habits of the household.

The interviewers receive the list of selected persons they are to interview from the Statistics Canada Regional Office. In some areas the interviewer is accompanied by the Public Health Nurse who can introduce her in the household and may be instrumental in gaining the co-operation of the selected persons.

The third stage of the field operation is the survey clinic interviews. The composition of the clinic team is such that 12 persons can be interviewed during a two-hour period. Ordinarily, two sessions are held each afternoon and two each evening, however, the schedule is flexible enough to accommodate the patterns within the community being surveyed.

The persons who have agreed to take part in the survey are provided with transportation to and from the survey clinic. Participants undergo a dietary interview, medical history, dental and medical examinations, anthropometric measurement and collection of blood and urine samples.

It is apparent that the Nutrition Canada Survey demands a great deal of the respondents, and this would be expected to be reflected in the response rates. Non-response can occur at any of the three stages of the field operation, and various features have been introduced to adjust for and control the amount of non-response. Sampling ratios and sample sizes have been adjusted on the basis of the expected response rates at each stage. The complete field operation in each area is carried out within a three-week period. This reduces the amount of non-response due to mobility and also helps to maintain the interest of selected persons right up to the time of the clinic interviews.

The selection procedure described above permits the calculation of the probability of selection of each person in the sample. This allows for the calculation of survey estimates and estimates of the sampling variability.

The field work for the survey will be completed in September 1972. Data processing and analysis are being carried out by the Food and Drug Directorate. Some preliminary findings are expected to be released later this year. However, the main body of the data collected will not be available until 1973.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of Statistics Canada. All or any part of the data bank contents may be purchased on magnetic tape or as computer print-outs. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * *

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

- .. figures not available
- ... figures not appropriate or not applicable
- amount too small to be expressed
- nil or zero.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

MCD months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 3, Tables 1.1 to 1.9—Income and Expenditure Accounts

At the time of printing this issue of the Canadian Statistical Review it was not possible to incorporate recently completed National Income and Expenditure historical revisions. Thus data shown in Section 3 have already been superseded. At the end of the article in this issue on the Accounts, the reader will find summary results of the first quarter 1972 statistically comparable to the historical revisions. The results of the latter can be obtained in the form of a computer printout for a nominal fee of \$5.00 by writing to the General Time Series Staff, Statistics Canada, or calling 995-7406.

Section 3, Table 3.1—Financial Flows

Supplementary Financial Flows matrices for the Fourth Quarter 1971 and year ended December 1971 were published in the May 1972 issue of this publication.

Section 4, Table 10—Activities of the Unemployment Insurance Commission

The table has been restructured for 1972 to reflect activities of the Commission under the new Unemployment Insurance Act. Under the new Act, a "fund" does not exist and employer-employee contributions and total revenue will be available only on an annual basis. The beneficiaries series which was dropped at the end of June 1971 may be reintroduced in early 1973. It will be noted that the benefit-paid series has been expanded to show monies dispersed by the various types of benefit as allowed for in the new Act.

Section 6, Tables 1 to 18—Manufacturing

See note below on questionnaire included with this issue.

Section 12, Table 5—Operating Statistics of Canadian Pipelines

The series "Operating Revenues" of Natural Gas Carriers has been added to this table.

Section 13, Table 12—Federal Government Budgetary Expenditures

Commencing with this issue, this table contains Budgetary Expenditures by Principal Classes, as published in Table IV of the Department of Finance Statement of Financial Operations, and in the Canada Gazette.

SPECIAL INVITATION

Readers are invited to use the questionnaire in Section 6 to comment on the level of detail in the tables and the usefulness of the Weekly Supplement. The question on the level of detail is restricted to Section 6 only for reasons of space. We welcome any suggestion for improvement.

If the Review is shared by more than one reader, additional copies of the questionnaire are available on request.

National Income and Expenditure Accounts, First Quarter 1972

Preliminary estimates of the National Income and Expenditure Accounts indicate continued growth in the nation's output of goods and services in the first quarter of 1972, little change in the overall rate of increase in prices and a growth pattern similar to the fourth quarter of 1971. A feature of the first quarter, was a sharply rising rate of inventory investment.

Gross National Product at market prices is estimated to have risen by 2.2%, or \$2.1 billion, to a level of \$98.7 billion (seasonally adjusted at annual rates). This compares with a 2.1% increase in the fourth quarter. After discounting a rise of 1.1% in the overall implicit deflator, the volume of production is shown to have risen by 1%, a similar pace of advance as that of 0.8% shown by the revised estimate for the fourth quarter of 1971. (The previously published estimate had shown a stronger fourth quarter.)

Domestic demand (GNP plus imports less exports) continued to increase and to outpace production, resulting in an unusually large increase in the deficit in the balance of transactions with non-residents. Consumer outlays again posted a good gain, despite a fall in new automobile purchases. Housing construction, which has also been a major sustaining force in previous quarters, continued to advance. An important source of strength in the quarter was the increase in non-farm business inventories, which showed the largest accumulation since the fourth quarter of 1969. On the other hand, fixed capital formation, excluding housing, and exports were sluggish in the first quarter, in line with the performance displayed in the second half of 1971. Government current expenditure on goods and services rose at a substantially lower rate than in the previous three quarters.

Consumers increased their outlays on goods and services by 2.1%, or \$1,188 million. This represented a little over half of the total increase in the value of production. The rate of increase in the fourth quarter of 1971 was 2.6%. The somewhat lower rate of growth in the first quarter was entirely due to reduced expenditure on new cars, down 8.6% after an exceptionally strong performance in the four previous quarters. Excluding new cars, personal expenditure rose by 2.9% compared with 2.4% in the fourth quarter of 1971.

After taking account of the reduced outlays on new cars, personal outlays on durable goods were practically unchanged over the quarter. Outlays on semi-durable goods rose only marginally, after large gains in the previous three quarters. In contrast, outlays on non-durable goods rose by a very strong 3.3% — a marked acceleration over the average quarterly increase of 1.1% in the second half of 1971. Outlays on services, which tend not to show much variation in their rate of increase from quarter to quarter, rose by 2.5%, the same rate as in the previous quarter.

The current boom in housing construction, which started in mid-1970 and continued throughout 1971 was still evident in the early months of 1972. In the first quarter, the value of work put in place, which reflects new starts during the quarter and the backlog of construction started in previous periods, rose by 5.5% to reach a level of \$5,028 million. The number of units started, over 262,000, was one of the largest ever recorded. Starts were concentrated in single houses, which have a larger value on average than duplexes and apartments, thus accentuating the increase in the value of work put in place. The value of investment in single units rose by 17.7% — the largest quarterly gain in the past decade.

In the first quarter of 1972 the addition to non-farm business inventories of \$1,100 million was one of the largest recorded since the mid-1960's. The increased investment over the fourth quarter rate of accumulation of \$440 million amounted to \$660 million and contributed 30% to the increase in GNP. Inventory investment, which had been a source of weakness in 1970 and in the first half of 1971, again started to contribute to demand in the second half of 1971; the net accumulation then was, however, relatively modest.

In contrast with housing and with non-farm business inventory investment, spending on business plant and equipment in the first quarter of 1972 continued the pattern of small increases (especially in volume terms) of most recent previous quarters. The estimated gain in the first quarter of 1.7% was entirely due to an increase in machinery and equipment as indicated by shipments and imports, especially the latter. Non-residential construction remained practically unchanged for a second consecutive quarter. Because of sharply rising prices of construction materials in the quarter, the actual volume of such outlays declined by about 2%.

In the external sector, the balance of transactions on goods and services with non-residents has deteriorated continuously since the first quarter of 1971. It has moved from a position of large surpluses to reduced surpluses and finally to a large deficit in the fourth quarter of \$1,052 million. The deficit increased further in the first quarter by \$668 million to \$1,720 million.

The deterioration in the overall balance was entirely due to a much reduced surplus in the merchandise account from \$1,684 million down to \$652 million. This decline of \$1,032 million was one of the largest ever recorded. As in recent previous quarters, it was due to transactions with overseas countries, as the balance with the U.S. continued to improve. In the non-merchandise account, the deficit diminished by \$364 million to a level of \$2,372 million, reflecting lower interest and dividend payments after an irregularly large increase in the final quarter of 1971.

The sharp fall in the merchandise balance was again due to a much larger increase in imports than in exports. Imports, reflecting widespread gains, rose by 7.2% to a level of \$17,704 million and exports by 0.9% to a level of \$18,356 million. In merchandise exports, very large declines were recorded in wheat and wheat flour. It may be noted, however, that preliminary data indicate a strong resurgence in exports in the month of April.

The salient feature on the income side was a large gain of 2.8% in labour income, a sharp acceleration over the rates of around 2% in the previous two quarters. Part of the acceleration was due to an unusually large increase of 8.7% in supplementary labour income (which consists of

employer contributions to welfare and pension funds), as larger rates of employer contributions to the Unemployment Insurance Fund together with increased coverage came into effect at the beginning of January. Wages and salaries excluding supplementary labour income rose by 2.5% as a result of increases in both employment and average earnings. Although both goods-producing industries and service-producing industries registered larger percentage increases in wages and salaries than in the previous quarter, the percentage increases in the service-producing industries of 2.9% continued to greatly exceed that in the goods-producing industries, 1.8%.

Preliminary estimates of corporation profits indicate a 1.2% gain in the first quarter, less than the 1.8% shown in the revised fourth quarter of 1971. The first quarter gain came on top of much sharper increases during most of 1971.

Price Movements

The implicit price index for Gross National Expenditure rose by 1.1% — approximately the same rate as in the previous quarter. It may be noted that the prices of most components of demand rose at an accelerated pace in the quarter. However, this acceleration was not reflected in the overall implicit price index, due to a large weight shift between inventories, with a low deflator in the quarter, and other GNE components.

The implicit price index for personal expenditure rose at a markedly higher rate in the first quarter, 1.4% versus 0.5% in the fourth quarter. The price acceleration occurred in the goods categories, especially in durable goods, where a 1.2% price rise followed a 0.6% decline in the previous quarter. Much of the rise in this price index was due to the changed composition of demand for durable goods, as expenditure on new cars, which have a relatively low deflator, declined sharply while expenditures on other items rose. The very sharp rise in the price index for non-durable goods, up 1.7% compared with 0.6% in the fourth quarter, was mostly due to widespread increases in food prices.

In the fixed capital formation sector, construction prices rose very strongly in the quarter. The price index for residential construction was up by 1.8%, as a result of increases in both labour costs and materials prices, but especially the latter. The non-residential construction price index rose at about the same rate, 1.7%, mostly because of very substantial increases in the materials and labour components of the engineering price index. The rate of increase in the price index for non-residential building rose moderately. The implicit price index for machinery and equipment rose by 0.5%.

In the external sector, the implicit price index for exports of goods and services was up 1.5%, after a slight drop in the fourth quarter; with the goods and services components both rising at about the same rate. Import prices rose by 1.7%.

(continued on page 113)

LABOUR FORCE (More detail in Section 4, Table 3)

The Labour Force, employment and unemployment levels declined this month from March. The April unemployment rate was 5.8.

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2.3)

The seasonally adjusted index of industrial production at 184.3 was unchanged in March from the upward revised level of February. The mining and manufacturing industries both registered declines. The decrease in manufacturing output originated with durable goods industries. The output of electric power, gas and water utilities increased.

		total industrial production (1961=100)	manufacturing (1961=100)			(1961=100)

RETAIL TRADE, NEW MOTOR VEHICLE SALES (More detail in Section 6, Table 16 and Section 10, Table 1)

Seasonal increases of 6.8 and 6.6 percent, respectively, in sales by motor vehicle dealers and women's clothing stores were insufficient to offset an overall decline of 0.1 per cent in Canadian retail trade between February and March 1972. Major contributors to the decline included shoe stores, jewellery stores and fuel dealers.

In March seasonally adjusted motor vehicle sales rose by 0.7%, North American passenger cars rose by 2.5%, overseas manufactured cars by 0.2% and commercial vehicle sales dropped 4.0%.

REAL DOMESTIC PRODUCT, (More details in Section 3, Table 2.1)

The R. D. P. index resumed its pattern of growth in March after levelling off in the first two months of the year. In March the service-producing industries grew at their fastest pace since 1966. Trade was very strong, and transportation recovered from its low January level.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in form inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from form stocks and the change in other form-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include oil transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

Table 2.3: industrial production, volume indexes (1961 = 100), based on the 1960 standard industrial classification - continued

year and month		durable manufacturing															
		primary metal industries					metal fabricating (ex mach. & transportation equipment)										
		total	iron & steel mills	steel pipe & tube mills	iron foundries	smelting and refining	total	boiler & plate works	fabricated structural metal	ornamental & architectural metal	metal stamping & pressing & coating	wire & wire products	hardware, tool & cutlery	machinery (except electrical)	total	aircraft and parts	motor vehicles ¹

¹Receipts and payments in this summary are Balance of Payments data. They are consistent with Gross National Expenditure concepts after adjusting for withholding tax additions and revisions not yet reflected in the National Income and Expenditure accounts. ²Trade of Canada figures with certain valuation and timing adjustments appropriate for Balance of Payments.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. Source: The Labour Force (71-001), Statistics Canada.

¹See footnote 1, table 3. Labour force obtained as the sum of employed and unemployed from tables 5 and 7. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force, (71-001), Statistics Canada.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force (71-001), Statistics Canada.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

Source: Labour Gazette, Department of Labour.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below.²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. Source: Employment and Average Weekly Wages and Salaries (72-002), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. ¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e., girls' under size 4 and infants' and "little children's". ¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing at maker's own plant.

⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), Statistics Canada.

¹Production plus imports less re-exports, minus exports.²Data for 1969, 1970 and 1971, have been revised and are shown here for the first time. Full details will be shown in New Motor Vehicle Sales, 1971 (Cat. no. 63-208). ³Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentones plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D.B.S.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refineryproduction (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William-Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1970 and 1971 price indexes are subject to revision. ³1971 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), Statistics Canada.

Note: Components may not add to totals due to rounding.

¹Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data excludes consumer indebtedness arising from residential mortgages home-improvement loans and bank loans fully-secured against marketable securities. Figures do not include statistics on interpersonal loans and bills owing to doctors, dentists, lawyers, and other personal service credit as they are not available. ²Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. Starting with January 1970 this series affected by transfer of passenger cars financed for commercial purposes from consumer goods to commercial goods; from January 1971 amounts shown exclude unearned finance charges; for December 1970 this change had the effect of reducing the gross figure by 13.5 per cent. ⁴Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁵Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁶The data for Quebec savings banks loans are not seasonally adjusted as no seasonality is present; this series is repeated in the unadjusted form. ⁷Till December 1970 data for only Oil Companies. From first quarter 1971 figures include statistics for transportation and travel and entertainment card-issuing companies. For seasonal adjustment purposes seasonal factors for oil company credit cards were used to adjust the new series other credit card issuers on the assumption that the two series are subject to the same seasonal effects. ⁸Bills due for residential/domestic use of telephones, gas and electric power. Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada, and Dept. of Insurance.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Form machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Same series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), Statistics Canada.

Table 1: carloadings of revenue freight on Canadian railways¹ (thousand cars)

¹Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Trans-air) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Note: Nordair was put into Financial Level II (from III) in January 1970 i.e. 1969 and previous dates do not include Nordair. Source: Civil Aviation (51-001), Statistics Canada.

¹Barrels of 35 Canadian gallons. ²Data from February 1967 onwards for net receipts include gathering and trunk lines. Prior to that date they include trunk lines only. ³Excludes distribution systems. ⁴Received from field and processing plants by transport systems. Sources: Oil Pipeline Transport (55-001) and Gas Utilities (55-002), Statistics Canada.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, Statistics Canada.

National Income and Expenditure Accounts
(continued from page 6)

The following Tables contain summary results of the Gross National Product and its major components for the first quarter of 1972 and corresponding quarterly data for the two preceding years. The data form part of a major historical revision of previously published series, which will cover the years 1947 to 1971 inclusive. The revisions to the National Income and Expenditure Accounts and the new data sources and methodology will be commented upon in a forthcoming publication in more detail. It is useful, however, to point out here some of the major changes affecting GNP.

The impact of the revisions on annual growth rates for GNP in current dollars and in volume terms is generally very small, as is the impact on the overall implicit price index. One important exception is 1970, which now shows a lower rate of increase in current dollars and a higher rate of increase in implicit price, resulting in a volume growth of 2.5% instead of 3.3% as previously shown.

Revisions have affected quarterly movements rather more than annual movements. The main consequence of these changes has been to shift the estimate of the start of the recovery from the fourth quarter of 1970 to the first quarter of 1971. This shift was largely due to revisions in the value of physical change in non-farm business inventories.

Although the annual and quarterly movements were not radically affected, the revisions resulted in sizable changes in the level of GNP and its components. On the expenditure side, personal expenditure on consumer goods and services and government current expenditure on goods and services were raised substantially. In 1971, the upward revisions to personal expenditure amounted to \$785 million (or 1.5%) over the previously estimated level. This was mainly due to a revision in expenditures on services of \$1,281 million (6.3%). Outlays on goods as a whole were not substantially changed, although there were sizable shifts between the three major categories, with durable and semi-durable goods being revised upward by \$1,303 million (20.1%) and \$1,728 million (31.5%) respectively, while non-durable goods were revised downward by \$3,527 million (16.9%). The revision to government current expenditure on goods and services amounted to \$648 million (3.7%). On the income side, there were significant upward revisions to corporation profits before taxes and to the rent portion of net income on unincorporated business. In 1971, the former was revised by \$515 million (6.0%) and the latter by \$724 million (14.8%). Other income components of GNP were revised downward, the largest change being in wages and salaries, down by \$452 million (0.9%) in 1971.

Another result of the revisions was the lowering of personal saving in absolute terms and as a proportion of personal disposable income. For 1971 personal saving is estimated to have been \$352 million less than previously published indicating a saving ratio of 7.8% instead of 8.5%.

14. (Gross national product at market prices excluding accrued net income of farm operators)	(87,900)	(90,436)	(93,032)	(94,812)	(91,545)	(97,496)		

(1) Excludes profits of government business enterprises.

(2) Includes the withholding tax applicable to this item.

(3) Includes profits (net of losses) of government business enterprises and other government investment income.

(4) Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the change in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.

(5) Includes net income of independent professional practitioners.

(6) See footnote 4, of Table B1.

15. Farm and grain in commercial channels (5)	324	52	- 4	- 12	90	- 68		
16. Exports of goods and services	21,652	21,988	22,552	22,708	22,225	22,712		
17. Deduct: Imports of goods and services	-20,764	-21,628	-22,484	-23,760	-22,159	-24,432		
18. Residual error of estimate	28	448	656	624	439	792		
19. GROSS NATIONAL EXPENDITURE AT MARKET PRICES	89,308	91,828	94,644	96,596	93,094	98,740		
Detail of farm inventories and GICC:								
Value of grain crop production	1,588	1,588	1,588	1,588	1,588	1,316		
Depletions of farm stocks of grain ..	- 1,328	- 1,404	- 1,500	- 1,548	- 1,445	- 1,300		
Change in other farm-held inventories	116	64	84	112	94	40		
Grain in commercial channels	- 52	- 196	- 176	- 164	- 147	- 124		

- (1) Includes defence expenditures. Details are shown in line 44, Table 16 of the forthcoming publication "National Income and Expenditure Accounts, First Quarter 1972" (Cat. No. 13-001).
- (2) Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.
- (3) Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.
- (4) The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The differences between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table A1.)
- (5) In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one-fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table A1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

18. Residual error of estimate	28	332	480	460	325	556		
19. GROSS NATIONAL EXPENDITURE IN CONSTANT (1961) DOLLARS	65,852	66,608	68,396	68,940	67,449	69,664		

(1) The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

C1. Gross National Expenditure in Constant (1961) Dollars, by Quarters, 1970 (1)
Seasonally Adjusted at Annual Rates
(\$ millions)

	1970				
	I	II	III	IV	Year
1. Personal expenditure on consumer goods and services	38,800	39,028	39,732	40,216	39,444
2. Government current expenditure on goods and services	9,940	10,244	10,212	10,468	10,216
3. Gross fixed capital formation	13,564	13,292	13,652	13,780	13,572
4. Government	2,348	2,320	2,340	2,420	2,357
5. Residential construction	12	8	12	12	11
6. Non-residential construction	2,028	2,020	2,040	2,108	2,049
7. Machinery and equipment	308	292	288	300	297
8. Business	11,216	10,972	11,312	11,360	11,215
9. Residential construction	2,680	2,436	2,568	2,776	2,615
10. Non-residential construction	3,864	3,824	3,908	3,936	3,883
11. Machinery and equipment	4,672	4,712	4,836	4,648	4,717
12. Value of physical change in inventories	288	812	516	-1,300	79
13. Government	- 4	- 4	- 4	- 48	- 15
Business					
14. Non-farm	376	776	900	-1,132	230
15. Farm and grain in commercial channels	- 84	40	- 380	- 120	- 136
16. Exports of goods and services	17,164	17,264	17,352	17,316	17,274
17. Deduct: Imports of goods and services .	-16,680	-16,716	-17,032	-15,720	-16,537
18. Residual error of estimate	292	- 148	- 136	- 436	- 107
19. GROSS NATIONAL EXPENDITURE IN CONSTANT (1961) DOLLARS	63,368	63,776	64,296	64,324	63,941

(1) The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.
